## CONTRACTOR STATEMENT OF INDEPENDENT TECHNICAL REVIEW

Science Applications International Corporation (SAIC) has completed the Draft Safety and Health Plan for the Revision of the Facility-Wide Environmental Documents at the Ravenna Army Ammunition Plant, Ravenna, Ohio. Notice is hereby given that an independent technical review has been conducted that is appropriate to the level of risk and complexity inherent in the project. During the independent technical review, compliance with established policy principles and procedures, utilizing justified and valid assumptions, was verified. This included review of data quality objectives; technical assumptions; methods, procedures, and materials to be used; the appropriateness of data used and level of data obtained; and reasonableness of the results, including whether the product meets the customer's needs consistent with law and existing USACE policy.

Sally Absher

Study/Design Team Leader

11-11-10

Date

Steve Davis, CIH, CSP

Independent Technical Review Team Leader

10-25-10

Date

Significant concerns and the explanation of the resolution are as follows:

Internal SAIC Independent Technical Review comments are recorded on a Document Review Record per SAIC quality assurance procedure QAAP 3.1. This Document Review Record is maintained in the project file. Changes to the report addressing the comments have been verified by the Study/Design Team Leader. As noted above, all concerns resulting from independent technical review of the project have been considered.

## 1.0 INTRODUCTION

---

Science Applications International Corporation (SAIC) prepared this Facility-wide Safety and Health Plan (FWSHP) for environmental investigations at the Ravenna Army Ammunition Plant (RVAAP), Ravenna, Ohio, under contract number W912QR-08-D-0008, delivery order number 0016 with the U.S. Army Corps of Engineers (USACE), Louisville District. This FWSHP is developed in accordance with U.S. Army and Ohio Environmental Protection Agency (Ohio EPA) guidance documents to meet the requirements for the investigation of known or suspected contaminated sites regulated under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); the Resource Conservation and Recovery Act (RCRA); and other federal or state regulations that govern environmental restoration activities at RVAAP. This FWSHP accompanies, and is to be used in conjunction with, a Facility-wide Field Sampling Plan (FSP) and Facility-Wide Quality Assurance Program Plan (QAPP) to provide consistent programmatic and technical requirements for environmental investigations at RVAAP.

This FWSHP sets forth the minimum requirements for protecting personnel involved in environmental investigations at the RVAAP. Standard procedures must be used to minimize the potential for personnel injury or illness. These will include on-site training, routine inspections, visual and instrument surveillance for munitions and explosives of concern (MEC) at Munitions Response Sites (MRSs), and enforcement of the health and safety requirements by project management. This plan follows and addresses requirements in the USACE's *Safety and Occupational Health Requirements for Hazardous, Toxic, and Radioactive Waste and Ordnance and Explosive Waste Activities* (USACE 2007). This FWSHP complies with the requirements of the *USACE Safety and Health Requirements Manual* (USACE 2008); relevant Occupational Safety and Health Administration (OSHA) regulations; and other applicable federal, state, and local government safety and health requirements. This plan provides Contractors with guidance on health and safety hazards and controls. Nothing in this document relieves the Contractor from the requirement to comply with all applicable portions of the *USACE Safety and Health Requirements Manual* and OSHA regulations and to provide a safe workplace.

This FWSHP serves as an upper-tier document addressing the hazards and controls expected to be common to the environmental investigations of all RVAAP areas of concern (AOCs) and the anticipated on-site tasks. Currently, environmental investigations are conducted at 29 installation restoration program (IRP) AOCs, two facility-wide AOCs, 13 Compliance Restoration Sites, and 13 MRSs (Figure 1-1).

A Contractor and investigation-specific Site Safety and Health Plan (SSHP) Addendum must be prepared to address the specific hazards and controls relevant to work at each AOC or investigation prior to beginning work at that particular AOC. Each addendum must reference this FWSHP or all those items not duplicated within it. Details such as a description of site conditions, maximum anticipated contaminant concentrations, and investigation-specific variations from this FWSHP will be presented in project-specific addenda. Work cannot be performed under this FWSHP without

1 being accompanied by an investigation-specific SSHP Addendum for each AOC or investigation. A  
2 copy of this FWSHP and the appropriate SSHP Addendum will be present at each work site. Each  
3 SSHP Addendum must contain Contractor- and investigation-specific details in addition to all  
4 elements outlined in Appendix A of the *USACE Safety and Health Requirements Manual* including:

- 5  
6 • Signature Page – Title, signature, and phone number of the Contractor’s plan preparer,  
7 approver, and concurrence.  
8
- 9 • Background Information – Contractor, contract number, project name, and brief description  
10 of work to be performed.  
11
- 12 • Statement of Contractor’s Safety and Health Policy – Copy of the current corporate/company  
13 safety and health policy statement.  
14
- 15 • Responsibilities and Lines of Authority – List of Contractor personnel for each project  
16 position described in Section 4.0 of this FWSHP.  
17
- 18 • Subcontractors and Suppliers – List of subcontractors and suppliers and their safety  
19 responsibilities.  
20
- 21 • Training – Update Table 5-1 of this FWSHP to include all investigation-specific training  
22 requirements.  
23
- 24 • Safety and Health Inspections – Procedures for conducting daily inspections including  
25 documentation deficiency tracking, follow-up, and external inspections.  
26
- 27 • Accident Reporting – Procedures and personnel responsible for exposure data, accident  
28 investigation, reports, and logs.  
29
- 30 • Plans (programs and procedures) Required by the Safety Manual – Procedures or programs  
31 for each activity and on mandatory OSHA compliance programs not included in Section 10.0  
32 of this FWSHP. The Contractor shall address all applicable occupational risks and  
33 compliance plans using Appendix A of the *USACE Safety and Health Requirements Manual*  
34 as a guide.  
35
- 36 • Risk Management Processes – Project-specific hazards and controls developed for each major  
37 phase or activity of work based on the Activity Hazard Analysis (AHA) provided in Table 3-  
38 2 of this FWSHP. Each SSHP Addendum must include investigation-specific AHAs and  
39 Risk Assessment Codes.

## 2.0 FACILITY DESCRIPTION AND CONTAMINATION CHARACTERIZATION

---

### 2.1 SITE DESCRIPTION

When the RVAAP IRP began in 1989, RVAAP was identified as a 21,419-acre installation. The property boundary was resurveyed by the Ohio Army National Guard (OHARNG) over a 2-year period (2002 and 2003) and the total acreage of the property was found to be 21,683.289 acres. As of February 2006, a total of 20,403 acres of the former 21,683-acre RVAAP has been transferred to the National Guard Bureau and subsequently licensed to OHARNG for use as a military training site.

The current RVAAP consists of 1,280 acres scattered throughout the OHARNG Camp Ravenna Joint Military Training Center, herein referred to as Camp Ravenna (Figure 2-1). Camp Ravenna is in northeastern Ohio within Portage and Trumbull Counties, approximately 3 miles (4.8 km) east-northeast of the city of Ravenna and approximately 1 mile (1.6 km) northwest of the city of Newton Falls (Figure 2-1). The RVAAP portions of the property are solely located within Portage County. RVAAP/Camp Ravenna is a parcel of property approximately 11 miles (17.7 km) long and 3.5 miles (5.6 km) wide bounded by State Route 5, the Michael J. Kirwan Reservoir, and the CSX System Railroad on the south; Garret, McCormick, and Berry roads on the west; the Norfolk Southern Railroad on the north; and State Route 534 on the east. Camp Ravenna is surrounded by several communities: Windham on the north; Garrettsville 6 miles (9.6 km) to the northwest; Newton Falls 1 mile (1.6 km) to the southeast; Charlestown to the southwest; and Wayland 3 miles (4.8 km) to the south (Figure 2-1).

When RVAAP was operational, Camp Ravenna did not exist and the entire 21,683-acre parcel was a government-owned, contractor-operated industrial facility. The RVAAP IRP encompasses investigation and cleanup of past activities over the entire 21,683 acres of the former RVAAP. References to RVAAP in this document are considered to be inclusive of the historical extent of RVAAP, which is inclusive of the combined acreages of the current Camp Ravenna and RVAAP, unless otherwise specifically stated. Industrial operations at the former RVAAP consisted of 12 munitions-assembly facilities referred to as "load lines." Load Lines 1 through 4 were used to melt and load 2,4,6-trinitrotoluene (TNT) and Composition B into large-caliber shells and bombs. The operations on the load lines produced explosive dust, spills, and vapors that collected on the floors and walls of each building. Periodically, the floors and walls were cleaned with water and steam. Following cleaning, the wastewater, containing TNT and Composition B, was known as "pink water" for its characteristic color. Pink water was collected in concrete holding tanks, filtered, and pumped into unlined ditches for transport to earthen settling ponds. Load Lines 5 through 11 were used to manufacture fuzes, primers, and boosters. Potential contaminants in these load lines include lead compounds, mercury compounds, and explosives. From 1946 to 1949, Load Line 12 was used to produce ammonium nitrate for explosives and fertilizers prior to use as a weapons demilitarization facility.

1 In 1950, the facility was placed in standby status and operations were limited to renovation,  
2 demilitarization, and normal maintenance of equipment, along with storage of munitions. Production  
3 activities were resumed from July 1954 to October 1957 and again from May 1968 to August 1972.  
4 In addition to production missions, various demilitarization activities were conducted at facilities  
5 constructed at Load Lines 1, 2, 3, and 12. Demilitarization activities included disassembly of  
6 munitions and explosives melt-out and recovery operations using hot water and steam processes.  
7 Periodic demilitarization of various munitions continued through 1992.

8  
9 In addition to production and demilitarization activities at the load lines, other facilities at RVAAP  
10 include AOCs that were used for the burning, demolition, and testing of munitions. These burning  
11 and demolition grounds consist of large parcels of open space or abandoned quarries. Potential  
12 contaminants at these AOCs include explosives, propellants, metals, and waste oils. Other types of  
13 AOCs present at RVAAP include landfills, an aircraft fuel tank testing facility, and various general  
14 industrial support and maintenance facilities.

## 15 16 **2.2 CONTAMINANTS**

17  
18 The RVAAP AOCs were associated with the assembly, storage, shipment, and/or disposal of a variety  
19 of materials including munitions and wastes. The principal munitions assembled on the installation  
20 were artillery rounds of 90 mm or more and 2,000-lb bombs. Chemicals of concern that are  
21 potentially present include explosive compounds (i.e., cyclonite, TNT, and smokeless powder),  
22 propellants, polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), and metals  
23 (i.e., aluminum, arsenic, barium, cadmium, chromium, lead, manganese, mercury, selenium, silver,  
24 and zinc). Contaminants that are potentially present at each AOC must be discussed in an  
25 investigation-specific SSHP addendum.

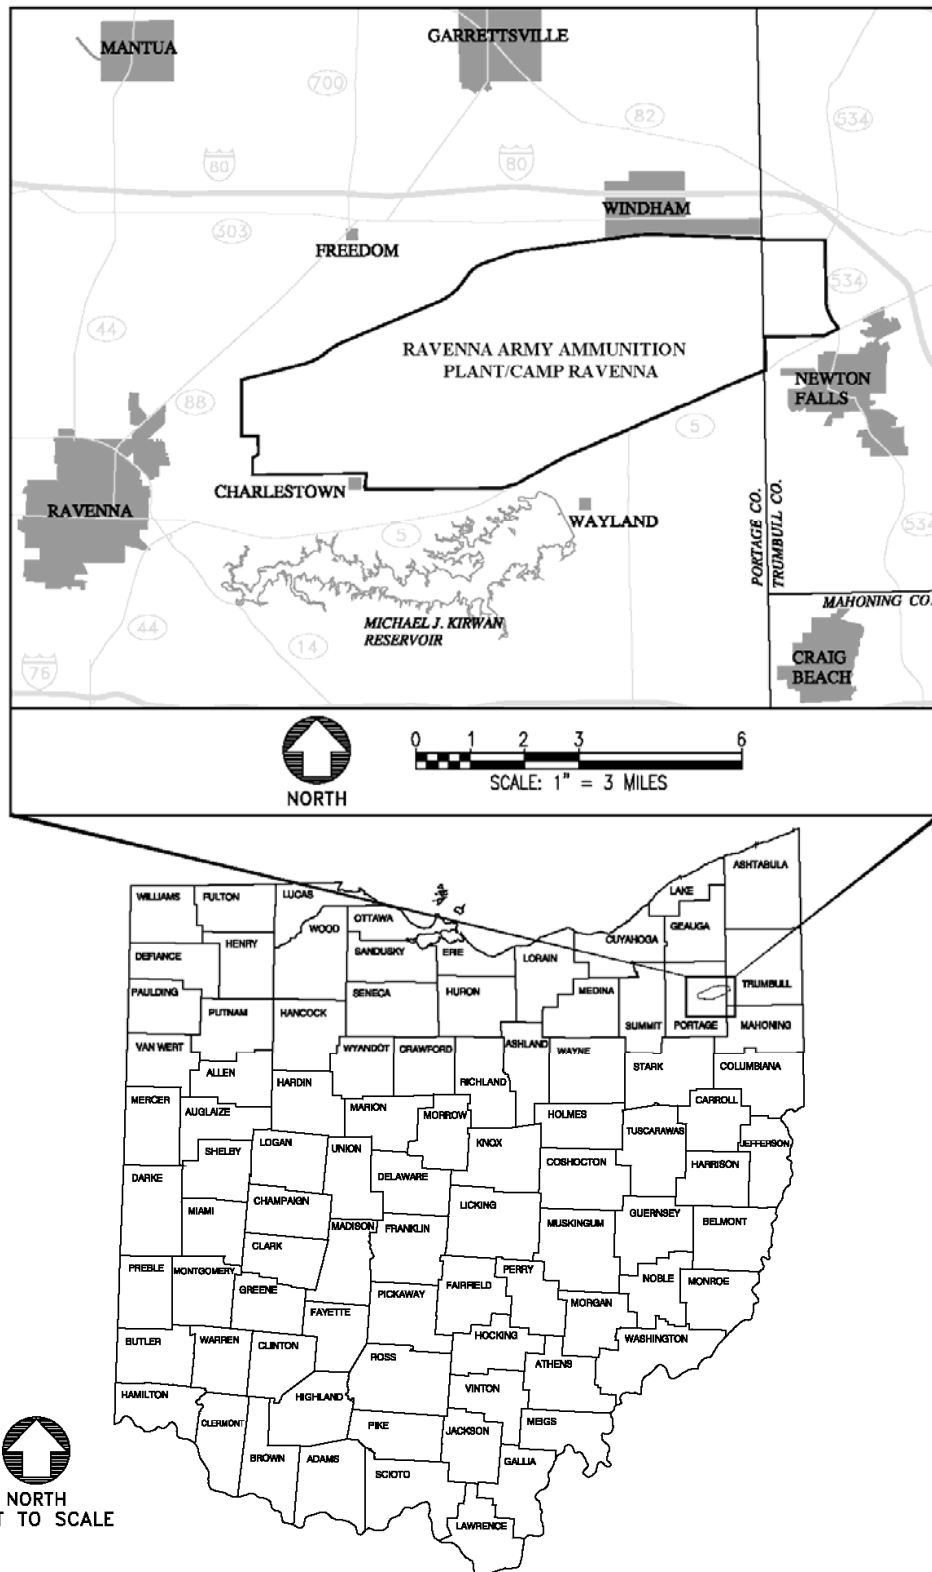

Figure 2-1. General Location and Orientation of RVAAP/Camp Ravenna

**THIS PAGE INTENTIONALLY LEFT BLANK.**

### 3.0 HAZARD/RISK ANALYSIS

The AHA identifies and assesses potential hazards that may be encountered by personnel and prescribes the required controls. Table 3-1 is a checklist of common hazards that may be posed during environmental investigations at RVAAP, and indicates whether a particular major type of hazard is present. The tasks are expected to consist of clearing vegetation; trenching; collecting surface soil, subsurface soil, sediment, and surface water samples; installing and abandoning piezometers and monitoring wells; decontaminating equipment, and managing IDW. In general, given these tasks, the potential for unacceptable exposure to contaminants appears to be low. Expected tasks present a variety of physical hazards including biological, contact with equipment or MEC, falls into excavations, engulfment by loose soil in an excavation, noise, and heat/cold stress. The Contractor must include an assessment of project-specific hazards by completing a hazard inventory (Table 3-1) in the SSHP Addendum.

**Table 3-1. Hazards Inventory**

Yes	No	Hazard
	X	Confined space entry (Not anticipated. Any confined space entry will require assessment in project-specific SSHP addenda and compliance with Section 10.5)
	X	Excavation entry (Not anticipated. Any excavation entry will require sloping or shoring excavation and compliance with all other applicable requirements)
X		Heavy equipment (i.e., drill rigs, Geoprobos, and backhoes)
X		Potential dangerous tools (i.e., brush clearing with chainsaws, machetes, sling blades)
X		Heavy lifting (IDW handling)
X		Fire (fuels)
X		Spills or leaks
X		Explosion (MEC)
X		Electrical shock (electrical equipment)
X		Exposure to chemicals (e.g., site contaminants and chemicals used during site work)
X		Temperature extremes
X		Biological hazards (i.e., poison ivy, Lyme disease, Histoplasmosis, and West Nile)
	X	Radiation or radioactive contamination
	X	Gunfire (No environmental contractors will perform work during OHARNG hunts)
X		Noise (equipment)

IDW = Investigation Derived Waste

MEC = Munitions and Explosives of Concern

OHARNG = Ohio Army National Guard

SSHP = Site Safety and Health Plan

### 3.1 TASK-SPECIFIC ACTIVITY HAZARD ANALYSIS

Table 3-2 presents AHAs, including task-specific job steps, hazards, actions to eliminate or minimize hazards, equipment to be used, and inspection and training requirements, if appropriate, for all of the planned environmental investigation activities at RVAAP. Specific sampling tasks considered in this document are as follows:

- Site mobilization and demobilization;
- Site walk and/or civil survey
- Soil sampling with excavation equipment;
- Soil boring and sampling, monitoring well installation using a drill rig and groundwater sampling;
- Soil boring and sampling using direct push technology (DPT);
- Monitoring well and borehole abandonment;
- Soil, sediment or surface water sampling using hand augers, scoops or sediment sampler on foot;
- Surface water and sediment collection from a boat using hand augers and hand tools;
- Vegetation clearing with chainsaws, machetes and sling blades;
- IDW handling; and
- Equipment decontamination.

The hazard assessments for each of these tasks are based on USACE expectations, as presented in the *USACE Safety and Health Requirements Manual* (USACE 2008), and some assumptions regarding the planned activities. Ultimately, the Contractor is responsible for ensuring that the hazards of each activity are adequately controlled. In cases where the following controls are not appropriate or sufficient for the specific task(s) to be performed by the Contractor, the Contractor must specify additional appropriate and sufficient controls by submitting an AHA with the investigation-specific SSHP Addendum. Work requiring lead control and asbestos disturbance will require a separate compliance plan as an attachment or appendix to the project-specific SSHP addenda. These compliance plans will be consistent with standards in Section 06.B.05 of the *USACE Safety and Health Requirement Manual*. The Contractor must use CELRL Form 1259, or the most currently approved USACE form, to complete the AHAs. Each applicable AHA must be approved by the

1 Contractor Certified Industrial Hygienist (CIH), or designee, and must include a completed Risk  
2 Assessment Code (RAC).  
3

### 4 **3.2 POTENTIAL EXPOSURES**

5

6 Table 3-3 provides information on the significant suspected contaminants and the chemical tools that  
7 may be used to investigate all AOCs. Note that Table 3-3 includes contaminants known or suspected  
8 to occur at any of the AOCs at concentrations sufficient to pose a risk of overexposure. Information  
9 on contaminants and chemical tools for work at a specific AOC must be included in each  
10 investigation-specific SSHP Addendum.

Recommended Protective Clothing & Equipment:
Level D PPE

JOB STEPS	HAZARDS	ACTIONS TO ELIMINATE OR MINIMIZE HAZARDS	EM 385-1-1 (PARA REF)
General	Biological hazards (bees, mosquitoes, ticks, Lyme disease, histoplasmosis, wasps, and snakes)	Level D PPE Insect repellant, as necessary. Pant legs tucked into boots or otherwise closed to minimize tick entry or contact with harmful plants Inspect for ticks during the day and at the end of each work day (see Section 10.18) Avoidance of accumulations of bird or bat droppings (see Section 10.17) Protective ointments and/or specialized cleaners if working in areas with poisonous plants Site-specific instruction in recognition and avoidance of harmful plants and/or animals	EM 385-1-1 06.D
	Temperature extremes	Administrative controls (see Section 9.0) Cooled (shaded) or warmed break area depending on the season Routine breaks in established break area and unscheduled breaks, if needed (see Section 9.0) Chilled water if temperature exceeds 70°F Monitoring – ambient temperature measurements at least twice daily. Temperatures greater than 80°F, temperatures less than 30°F, and the use of impermeable clothing require additional controls (see Section 9.0) Site- and season-specific instruction in weather hazards and hazard controls	EM 385-1-1 06.I
	Contact with MEC	On-site training in ordnance recognition for all field personnel. Any investigation work within a MRS will follow MEC avoidance protocol. MEC surveys will be conducted in MRSs by a UXO technician for intrusive work and a UXO technician will accompany investigation teams. Avoid areas or withdraw all personnel from area, as directed by UXO technician, if ordnance or suspected ordnance is discovered. Monitoring - visual surveys for ordnance. Instrument surveys by UXO technicians in MRS. Follow requirements of governing Explosive Safety Submittal, if required, for the project.	EM 385-1-1 33.A

Date Prepared: July 1, 2010

Project: RVAAP Facility-wide Environmental Investigation Activities

Job: Site Mobilization and Demobilization

JOB STEPS	HAZARDS	ACTIONS TO ELIMINATE OR MINIMIZE HAZARDS	EM 385-1-1 (PARA REF)
General	Exposure to chemicals	Wash face and hands and any other exposed areas prior to taking anything by mouth. HAZWOPER training and medical clearance	EM 385-1-1 06.A and B, and Section 28
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Suspend fieldwork if lightning within 10 miles of site or tornado warning issued. Do not work in areas subject to flash flooding	EM 385-1-1 06.I
Vehicle Operation	Vehicle accidents	Vehicle operation (valid driver's license, seat belt use, routine vehicle inspections, no cell phone use while driving, compliance with applicable laws and regulations, and defensive driving). Visual inspection includes the vehicle and any associated items such as trailers or external cargo carriers. The operator verifies that the following items are present and functional: seatbelt(s), lights, turn signals, operating brakes, speedometer, fuel gage, horn, windshield, windshield wiper, defrosting/defogging system, rear view mirror, cab, non-slip surfaces on steps, and tires (approximately proper inflation) While driving on RVAAP, facility personnel shall take necessary precautions to avoid hitting deer	EM 385-1-1 18
Moving Equipment	Musculoskeletal injuries (lifting heavy items)	Maximum 50 lb per individual, safety shoes, mechanical assistance >50 lb An evaluation of potential pinch points and/or weight strain should be conducted. Clear area of all unnecessary equipment and slip/trip hazards. Additional help will be obtained by workers or mechanical assistance used on-site if equipment to be moved is unwieldy, has a weight >50 lb, or has to be moved by maneuvering through awkward positioning Plan activities so body is not twisted/contorted	EM 385-1-1 14.A
	General safety hazards (slips, trips, and falls)	Clean and organized work areas, keeping walkways and working areas clear	EM 385-1-1 2.B

MEC surveys will be conducted in MRSs by a UXO technician for intrusive work and a UXO technician will accompany investigation teams. Avoid areas or withdraw all personnel from area, as directed by UXO technician, if ordnance or suspected ordnance is discovered. Monitoring - visual surveys for ordnance. Instrument surveys by UXO technicians in MRS. Follow requirements of governing Explosive Safety Submittal, if required, for the project.	EM 385-1-1 33.A

CELRL Form 1259, 1 November 2001

Previous Versions are Obsolete and Should Not Be Used

Date Prepared: July 1, 2010

Project: RVAAP Facility-wide Environmental Investigation Activities

Job: Monitoring Well and Borehole Abandonment

JOB STEPS	HAZARDS	ACTIONS TO ELIMINATE OR MINIMIZE HAZARDS	EM 385-1-1 (PARA REF)
General	Lifting heavy items	Evaluate the lift and potential pinch points and/or weight strain. Clear area of all unnecessary equipment and slip/trip hazards. Additional help will be obtained by workers or mechanical assistance used on-site if equipment to be moved is unwieldy, has a weight >50 lb, or has to be moved by maneuvering through awkward positioning	EM 385-1-1 14.A
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Suspend fieldwork if lightning within 10 miles of site or tornado warning issued. Do not work in areas subject to flash flooding	EM 385-1-1 06.I
Drilling to Abandon Wells	General safety hazards (rotating machinery, suspended loads, moving equipment, slips, and falls)	Level D PPE (see Section 6.0) plus hard hat No employees under lifted loads At least two functional kill switches or switches that require continuous force to activate Functional back-up alarm Drill rig manual on-site Only experienced operators Exclusion zone at least equal to mast height	EM 385-1-1 18.H
	Noise	Hearing protection within 7.6 m (25 ft) of rig unless rig-specific monitoring indicates noise exposure of less than 90 dB Monitoring - daily safety inspections	EM 385-1-1 05.C
	Fire (vehicle fuels or subsurface contaminants)	Fuels stored in safety containers labeled/listed by nationally recognized testing laboratory Bonding and grounding during fuel transfers Fuel storage areas marked with "No Smoking" or "Open Flame" signs No ignition sources within 50 ft of fuel storage areas Fire extinguishers in all fuel use areas and inspected monthly Monitoring - combustible gas indicator if buried organic material or other source of flammable gas is suspected	EM 385-1-1 09.A
	Electric shock	Identification and clearance of overhead and underground utilities Monitoring - visual of all work areas 110-V electrical tools connected through GFCI	EM 385-1-1 05.I
	Struck by equipment, cables, drill rods	Level D+ PPE with hard hat. Maintain general work area awareness, separate work area from drill rig and moving parts where possible. Drilling subcontractor will operate per their own health and safety programs, plans, and procedures and will provide trained and qualified personnel. Driller will inspect the rig at the start of each shift. Drill rig will be equipped with at least two kill switches or will be operated by dead man switches. No workers under suspended heavy loads	EM 385-1-1 18.H
	Operating hand tools or power tools	Clean and organized work areas, keeping walkways and working areas clear. 110-V portable tools will be connected through GFCI	EM 385-1-1 13.A

Date Prepared: July 1, 2010

Project: RVAAP Facility-wide Environmental Investigation Activities

Job: Monitoring Well and Borehole Abandonment

Equipment to be Used	Inspection Requirements	Training Requirements
Drill rig  Support truck  Hand tools, if necessary	Daily safety inspections of operations. Initial and at least weekly inspections of excavation equipment  Daily vehicle inspection  All tools must be inspected daily and taken out of service if damaged	HAZWOPER 40-hr training and current refresher training  Medical clearance  Properly trained personnel to operate drill rig  Site-specific training including site hazard communication training  CPR and first aid training for at least two on-site personnel and at least one person per field team

3JOB STEPS	HAZARDS	ACTIONS TO ELIMINATE OR MINIMIZE HAZARDS	EM 385-1-1 (PARA REF)
General	Lifting heavy items	Evaluate lifts in advance. Clear area of all unnecessary equipment and slip/trip hazards. Additional help will be obtained by workers or mechanical assistance used on-site if equipment to be moved is unwieldy, has a weight >50 lb, or has to be moved by maneuvering through awkward positioning	EM 385-1-1 14.A
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Suspend fieldwork if lightning within 10 miles of site or tornado warning issued. Do not work in areas subject to flash flooding	EM 385-1-1 06.I
Operating equipment	General hazards (lifting equipment, manual lifting, and slips)	Level D PPE including heavy duty gloves for materials handling (see Section 6.0) Unnecessary personnel will stay well clear of operating equipment Functional back-up alarm on fork trucks, bobcats, trucks, etc. Documented forklift training for forklift operators Only experienced operators will be allowed to operate equipment No personnel allowed under lifted loads Lifts of over 50 lb will be made with two or more personnel or with lifting equipment Hazardous waste safety training Compliance with EM 385-1-1, Sections 14 and 16	EM 385-1-1 14.A and 18.G.29
	Load stability	All loads will be secured to the forklift with locking strap or equivalent. Whenever possible, loads will be transported without stacking	EM 385-1-1 14.A and 18.G.29
	Visibility	Ensure maximum visibility is available when transporting drums. If vision is obscured, drive in reverse if possible	EM 385-1-1 14.A
	Pinch points	Be aware of all pinch points when handling drums or containers. Heavy duty gloves	EM 385-1-1 14.A
	Musculoskeletal injuries (opening/closing drums)	Plan activities so body is not twisted/contorted. Evaluate potential pinch points. Use proper tools for the task. Lifts of more than 50 lb require mechanical assistance or buddy lift	EM 385-1-1 13.A
	Fire (vehicle fuels and flammable contaminants)	Fuels stored in safety containers labeled/listed by a nationally recognized testing laboratory Bonding and grounding during fuel transfers Fuel storage areas marked with "No Smoking" or "Open Flame" signs Fire extinguishers in all fuel use areas and inspected monthly No ignition sources within 50 ft of areas where flammable materials are stored	EM 385-1-1 09.A
	Noise	Hearing protection within 7.6 m (25 ft) of any noisy drum moving equipment unless equipment-specific monitoring indicates exposures less than 90 dB	EM 385-1-1 05.C
	Electric shock	Identification and clearance of overhead utilities. Maintain at least 10 ft from all electrical wiring, more for high-voltage systems. Electrical tools must be connected through GFCI	EM 385-1-1 05.I
	Exposure to chemicals	PPE (Level D) plus nitrile or equivalent gloves for contact with contaminated material. Washing face and hands prior to taking anything by mouth Minimal contact	EM 385-1-1 06.A and B

CELRL Form 1259, 1 November 2001

Previous Versions are Obsolete and Should Not Be Used

**Table 3-3. Potential Exposures**

<b>Chemical<sup>a</sup></b>	<b>Health Effects/Potential Hazards<sup>b</sup></b>	<b>Chemical and Physical Properties<sup>b</sup></b>	<b>Exposure Route(s)<sup>b</sup></b>
<i>Potential Chemical Exposures</i>			
Arsenic	Dermatitis, nasal tissue damage, stomach upset, potential cancer	Solid; VP: 0 mmHg; FP: NA	Inhalation Indigestion Absorption Contact
Asbestos	Asbestosis, difficulty breathing, interstitial fibrosis, restricted pulmonary function, finger clubbing, eye irritant, potential cancer	Solid; VP: 0 mmHg; FP: NA	Inhalation Ingestion Contact
Barium	Irritation of eyes, skin, lungs; muscle spasm	Solid; VP: Low; FP: NA	Inhalation Ingestion Contact
Chromium	Eye irritation, sensitization	Solid; properties vary depending upon specific compound	Inhalation Congestion Contact
Cadmium	Breathing difficulty, cough, chest tightness, pain beneath the sternum, headache, chills, aches, vomiting	Solid; VP: 0 mmHg; FP: NA	Inhalation Ingestion Contact
Dinitrotoluene	Suspected human carcinogen, anorexia, cyanosis, reproductive effects	Orange-yellow solid, VP: 1 mmHg; FP: 404°F	Inhalation Absorption Ingestion Contact
Lead	Weakness, anorexia, abdominal pain, anemia	Solid metal; VP: 0 mmHg; FP: NA; IP: NA	Inhalation Ingestion Contact
Mercury	Irritation of eyes and skin; coughing, gastrointestinal disturbance, anorexia	Silver liquid; FP: NA; VP: 0.0012 mmHg	Inhalation Absorption Ingestion Contact
PAHs and SVOCs	Suspected human carcinogen	PAHs are typically colorless, white, or pale yellow-green solid. Colorless liquid with almost no odor	Inhalation Ingestion Contact
Propellants (containing nitrocellulose and potentially nitroglycerin)	Faintness, rapid pulse, dizziness, muscle twitch, damage to blood cells, vomiting	Solid; VP: 0 mmHg; FP: NA May burn or explode if exposed to high temperatures or shock	Inhalation Ingestion Absorption Contact

**Table 3-3. Potential Exposures (continued)**

<b>Chemical<sup>a</sup></b>	<b>Health Effects/Potential Hazards<sup>b</sup></b>	<b>Chemical and Physical Properties<sup>b</sup></b>	<b>Exposure Route(s)<sup>b</sup></b>
Cyclonite	Explosive; irritation of eyes and skin, dizziness, weakness	White powder; FP: explodes; VP: 0.0004 mmHg at 230°F	Inhalation Absorption Ingestion Contact
Selenium	Irritation of eyes, skin, throat; liver and/or spleen damage	Solid; FP: NA; VP: 0 mmHg	Inhalation Ingestion Contact
Smokeless Powder (nitrocellulose)	Low toxicity	Amorphous solid; FP: 55°F	Not given
Trinitrotoluene	Irritation of skin and mucus membranes, liver damage, kidney damage	Pale solid; FP: explodes; VP: 0.0002 mmHg	Inhalation Absorption Ingestion Contact
VOCs (trichloroethene used as an example; however, properties vary depending upon the specific compound)	Irritant to eyes and skin; headache; visual disturbance; lassitude; dizziness; tremor; drowsiness; nauseous; vomiting; cardiac arrhythmias; paresthesia; damage to liver; potential cancer	Liquid; colorless; chloroform-like odor; VP: 58 mmHg; IP: 9.45 eV	Inhalation Absorption Ingestion Contact
Zinc	Irritant to eyes	Soft white metal with a bluish tinge	NA
<b><i>Decontamination Chemicals and Sample Preservatives</i></b>			
Hydrochloric Acid	Eye and skin irritation and/or destruction	Liquid with acrid odor; FP: NA; IP: NA	Inhalation Absorption Ingestion Contact
Isopropyl Alcohol	Irritation of eyes, nose, throat; drowsiness, dizziness, headache; dry cracking skin.	Colorless liquid with the odor of rubbing alcohol. VP: 33 mmHg; FP: 53°F; IP: 10.10 eV	Inhalation, ingestion, skin and/or eye contact
Liquinox (used for decontamination)	Inhalation of powder may cause local irritation of mucus membranes	White powder, odorless, nonflammable	Inhalation Ingestion Contact

**Table 3-3. Potential Exposures (continued)**

<b>Chemical<sup>a</sup></b>	<b>Health Effects/Potential Hazards<sup>b</sup></b>	<b>Chemical and Physical Properties<sup>b</sup></b>	<b>Exposure Route(s)<sup>b</sup></b>
Methanol (potentially used for equipment decontamination)	Eye and skin irritation, headache, cough; optic nerve damage	Liquid; VP: 96 mmHg; FP: 52°F; IP: 10.84 eV	Inhalation Absorption Ingestion Contact
Sulfuric Acid (H <sub>2</sub> SO <sub>4</sub> )	Irritant to eyes, skin, nose, throat; pulmonary edema; bronchitis; emphysema; conjunctivitis; stomatis, dental erosion; eye and skin burn; dermatitis	Liquid, colorless to dark brown, oily, odorless. VP: 0.001mmHg, FP: NA	Inhalation Ingestion Contact
Sodium Hydroxide (NaOH)	Irritant to eyes, skin, mucous membrane; pneumonia; eye and skin burns; temporary loss of hair	Solid, colorless to white, odorless VP: 0 mmHg; FP: NA, IP: NA	Inhalation Ingestion Contact
Nitric Acid (HNO <sub>3</sub> )	Irritant to eyes, skin, and mucous membrane; delayed pulmonary edema, pneumonia, bronchitis, dental erosion	Liquid, colorless, yellow, or red; acrid, suffocating odor VP: 48 mmHg; FP: NA; IP: 11.95eV	Inhalation Ingestion Contact
Zinc Acetate (only used as sample preservative for sulfide samples)	Not hazardous	Crystalline solid	
<b><i>Other Potential Exposures</i></b>			
Diesel (used for fuel for heavy equipment)	Irritation of eyes, skin, respiratory system; dizziness; headache; nausea; central nervous system	Brown, slightly viscous liquid, with characteristic odor; FP: 125.6°F	Inhalation Ingestion Contact
Diesel Exhaust	Irritation of eyes and respiratory system; potential occupational carcinogen	Appearance odor and properties vary depending upon the specific diesel exhaust component	Inhalation Contact
Gasoline (used for fuel)	Potential carcinogen per NIOSH, dizziness, eye irritation, dermatitis	Liquid with aromatic odor; FP: -45°F; VP: 38-300 mm	Inhalation Absorption Ingestion Contact
Silica Dust (from concrete cutting/breaking)	Cough, difficulty breathing, wheezing, decreased pulmonary function; progressive respiratory symptoms; irritant to eyes; potential cancer	Solid; colorless; odorless VP: 0 mmHg; FP: NA; IP: NA	Inhalation Contact

<sup>a</sup> The potential chemicals on this list reflect a partial compilation based on historical investigations conducted at RVAAP. Project-specific addenda must address specific potential exposure based on AOC operational history and anticipated activities to be conducted.

<sup>b</sup> From 1997 NIOSH Pocket Guide to Chemical Hazards, the Condensed Chemical Dictionary, Tenth Edition.

FP = Flash point.

IP = Ionization potential.

NA = Not available.

NIOSH = National Institute for Occupational Safety and Health

PAH = Polycyclic aromatic hydrocarbon.

SVOC = Semi-volatile organic compound.

VP = Vapor pressure.

## **4.0 STAFF ORGANIZATION, QUALIFICATIONS, AND RESPONSIBILITIES**

---

This section presents the general lines of authority, responsibilities, and communication procedures concerning site safety and health and emergency response. It includes key Contractor positions. The FWSHP project-specific addenda must contain a table that lists the responsible parties and telephone numbers for each of the following key contractor positions:

- Program Manager;
- CIH;
- Field Operations Manager;
- Site Safety and Health Officer (SSHO); and
- All subcontractors and suppliers.

### **4.1 CONTRACTOR PROGRAM MANAGER**

The Contractor Program Manager will ensure conformance with corporate and USACE policies and procedures. Specific responsibilities of the Contractor Program Manager are as follows:

- Coordinate with USACE personnel;
- Ensure project managers satisfy USACE health and safety requirements;
- Ensure project staff implement the SSHP;
- Ensure projects have the necessary resources to operate safely; and
- Ensure project personnel have the appropriate regard for safe job performance.

### **4.2 CONTRACTOR CERTIFIED INDUSTRIAL HYGIENIST**

The Contractor CIH manages the health and safety program. This includes establishing health and safety policies and procedures, supporting project and office activities, and verifying safe work practices and conditions. The specific responsibilities of the Contractor CIH are as follows:

- Coordinate with USACE health and safety personnel;
- Review and approve SSHPs;
- Approve downgrades in personal protective equipment (PPE) or protective procedures; and
- Interface with project personnel through routine communications and audits of selected projects.

### 4.3 CONTRACTOR PROJECT MANAGER

The Contractor Project Manager will be responsible for overall project execution. The responsibilities of the Contractor Project Manager are as follows:

- Coordinate with USACE personnel, including reporting accidents and incidents to the USACE Project Manager immediately and submitting written reports within 2 working days;
- Ensure implementation of this FWSHP and all project-specific addenda;
- Maintain auditable project documentation of all required records;
- Ensure that a qualified SSHO is designated; and
- Maintain a current copy of this FWSHP and the project-specific addenda.

### 4.4 CONTRACTOR FIELD OPERATIONS MANAGER

The Contractor Field Operations Manager will oversee the field activities associated with a project and is responsible for site accessibility, safety, and quality assurance. He/she will enforce the field requirements of this FWSHP and project-specific addenda. Specific responsibilities of the Contractor Field Operations Manager are as follows:

- Enforce compliance with this FWSHP and the project-specific addenda;
- Coordinate on-site operations, including subcontractor activities;
- Ensure that subcontractors follow the requirements of this FWSHP and the project-specific addenda;
- Coordinate and control any emergency response actions;
- Ensure that at least one person per field team, who is currently certified in first aid and cardiopulmonary resuscitation (CPR), is on-site during site operations; and
- Maintain current copies of this FWSHP, the project-specific addenda, and the *USACE Safety and Health Requirements Manual* (USACE 2008) on-site.

### 4.5 CONTRACTOR SITE SAFETY AND HEALTH OFFICER

The Contractor SSHO will implement this FWSHP and the project-specific addenda, make health and safety decisions for specific health and safety activities, and verify the effectiveness of the health and safety program. The Contractor SSHO's qualifications include, at a minimum, experience with

1 similar projects, knowledge of and understanding of this FWSHP and the project-specific addenda,  
2 and the ability to use the required monitoring equipment. The Contractor SSHO's primary  
3 responsibilities will be as follows:

- 4  
5 • Stop work or upgrade protective measures (including protective clothing) if uncontrolled  
6 health and safety hazards are encountered. Indications of uncontrolled health and safety  
7 hazards include monitoring instrument readings in excess of the established action limits,  
8 heavy equipment without back-up alarms, exposed unexploded ordnance (UXO), unguarded  
9 moving/rotating equipment, exposed electrical connections, non-compliance with health and  
10 safety requirements, encountering liquids other than water, soil staining suggestive of  
11 unexpectedly high concentrations of non-volatile contaminants. The SSHO authorizes  
12 resumption of work following correction of the adverse condition(s).  
13
- 14 • Implement and verify compliance with this FWSHP and the project-specific addenda and  
15 report to the Field Operations Manager, Project Manager, and Health and Safety Manager any  
16 deviations from anticipated conditions.  
17
- 18 • Conduct daily safety inspections using the form provided in Appendix A.  
19
- 20 • Document deficiencies identified in the daily inspections and responsible parties, procedures,  
21 and timetables for correction.  
22
- 23 • Ensure that site personnel have access to this plan and are aware of its provisions.  
24
- 25 • Conduct a site-specific pre-entry health and safety briefing covering potential chemical and  
26 physical hazards, safe work practices, and emergency procedures.  
27
- 28 • Maintain on-site auditable documentation of:  
29
  - 30 — Material Safety Data Sheets (MSDS) for applicable materials utilized at the site;
  - 31 — Daily tailgate and health and safety training for site workers and visitors (Appendix A);
  - 32 — Calibration/maintenance of field instruments such as photoionization detectors,
  - 33 combustible gas indicators (an example is included in Section 6.0 of the Field Sampling
  - 34 Plan [FSP]);
  - 35 — Calibration standards tracking (an example is included in Section 6.0 of the FSP);
  - 36 — Environmental and personal exposure monitoring results (Appendix A);
  - 37 — Notification of accidents/incidents (Appendix A);
  - 38 — Reports of any overexposure or excessive levels;
  - 39 — Notification of employees of exposure data; and
  - 40 — Medical surveillance.
- 41
- 42 • Confirm that all on-site personnel have received the required training (see Section 5.0).  
43

- 1 • Issue respirators, as necessary, and ensure that all respirator users have received medical  
2 clearance within the last year, have been properly trained, and have been successfully fitted  
3 for respiratory protection.  
4
- 5 • Verify that this FWSHP's and the project-specific addenda's emergency points of contact are  
6 correct and supply correcting information as necessary.  
7
- 8 • Ensure that all monitoring equipment is operating according to the manufacturer's  
9 specifications and perform field checks of instrument calibration.  
10
- 11 • Ensure monitoring for potential on-site exposures is conducted in accordance with this  
12 FWSHP and its project-specific addenda.  
13
- 14 • Investigate accidents and near accidents and report (in concert with the Contractor Field  
15 Operations Manager) findings to the Contractor Project Manager and Contractor CIH.  
16
- 17 • Conduct daily "tailgate" safety briefings using the form provided in Appendix A.  
18
- 19 • Control visitor access to the exclusion zone.

## 5.0 TRAINING

Personnel participating in the investigation of an AOC are subject to the training requirements presented in Table 5-1 and discussed below.

**Table 5-1. Training Requirements**

Training	Worker	Supervisor	Site Visitor (exclusion zone)
HAZWOPER (40-hr, 3-day OJT)	√	√	√
HAZWOPER Annual Refresher (8 hr)	√	√	√
HAZWOPER Supervisors Training (8 hr)		√	
CPR and First Aid Training (required for two personnel and a minimum of one person per field team)	√	√	√
General Hazard Communication Training (contained in 40- and 8-hr courses)	√	√	√
Respiratory Protection Training (required only if respirators are worn; contained in 40-hr course)	√	√	√
Hearing Conservation Training (for workers in hearing conservation program; contained in 40- and 8-hr courses)	√	√	√
Pre-entry Briefing	√	√	√
Site-specific Hazard Communication (contained in pre-entry briefing)	√	√	√
Safety Briefing (daily and whenever conditions or tasks change)	√	√	√
Equipment-specific Training (equipment operators)	√	√	

√ = Required

CPR = Cardiopulmonary Resuscitation

HAZWOPER = Hazardous Waste Operations and Emergency Response

OJT = On-the-Job Training

The following paragraphs briefly summarize the training requirements. These summaries include a course description and guidance on who must take each course.

### 5.1 OFF-SITE TRAINING

The 40-hr Hazardous Waste Site Worker course is required for hazardous, toxic, and radioactive waste activities in the exclusion (contamination) zone, contamination reduction (buffer) zone, or other hazardous areas on-site. Three days of relevant field experience are required in conjunction with this training.

The 8-hr Hazardous Waste Refresher course is required annually to maintain currency in the 40-hr course.

1 The Hazardous Waste Supervisor's Training is required for personnel who directly supervise  
2 hazardous waste site workers. This course must address the health and safety program and procedural  
3 requirements of the supervisor's company. Note that the 40-hr course is a prerequisite.

4  
5 General Hazard Communication Training is required for all site workers. This training must  
6 communicate the risks and protective measures for chemicals that employees may encounter. This  
7 requirement is met by taking the 40-hr Hazardous Waste Site Worker course and the site-specific  
8 hazard communication training addressing the chemicals in use on the project. MSDSs must be kept  
9 on-site during field investigations for all chemicals expected to be encountered or used on-site.

10  
11 At least two on-site employees must be certified in CPR and first aid. For multiple field teams  
12 working under the required buddy system, at least one field team member must be certified in CPR  
13 and first aid. The 43.5-hr American Red Cross Emergency Response training is no longer required.

14  
15 Respiratory Protection Training is required for all individuals who wear respirators. This requirement  
16 can be met by taking the 40-hr Hazardous Waste Site Worker course, annual refreshers, and  
17 site-specific training covering the types of respirators to be used on-site. Respirator fit-test  
18 certifications must be kept on-site for anyone who might wear one.

19  
20 Hearing Conservation Training is required on an annual basis by 29 *Code of Federal Regulations*  
21 (*CFR*) 1910.95 for all employees enrolled in a hearing conservation program. This requirement  
22 includes all employees exposed to occupational noise in excess of 85 dB on a time-weighted average.

## 23 24 **5.2 SITE-SPECIFIC TRAINING**

25  
26 Personnel on-site must receive the investigation-specific safety training. Two versions of this training  
27 will be used. The site worker version will contain full information regarding site hazards, hazard  
28 controls, and emergency procedures. A shortened version will be used for visitors who will be on-site  
29 for short times and who will not do hands-on work. This shortened version will contain the hazard  
30 information that is directly relevant to the purpose of the visit. Signatures of those attending and the  
31 type of briefing must be entered in the field logbook before site access will be granted. Note that  
32 casual visitors (e.g., package deliverers, observers) to the support zone (Administration Area-  
33 Buildings 1036, 1037, and 1038) will not be required to have the site-specific training. The site-  
34 specific training will include the following site-specific information:

- 35  
36
- Names of site health and safety personnel and alternates;
  - Contents of this FWSHP and the appropriate addendum;
  - Hazards and symptoms of contaminant exposure;
  - Hazards and symptoms of exposure to chemicals present in the workplace;
  - Physical hazards in the workplace;
  - Recognition and avoidance of live ordnance;
  - Site and task PPE (i.e., purpose, donning, doffing, and proper use);
  - Safe work practices to minimize risks;
- 43

- Safe use of engineering controls and equipment;
- Medical surveillance requirements;
- Site control measures;
- Reporting requirements for spills and emergencies;
- Personnel decontamination procedures;
- Contingency plans (e.g., communications, phone numbers, emergency exits, assembly point);
- Verification of communication with Post 1 (two-way radios and cell phones);
- Spill containment procedures (e.g., reporting, cleanup methods); and
- Emergency equipment locations and use (e.g., fire extinguishers, spill kits).

Safety briefings will be held at least daily and also when conditions or tasks change. These briefings will be conducted by the SSHO and/or Field Operations Manager and will be attended by all site workers and supervisors. These briefings will address site-specific safety issues and are used as an opportunity to refresh workers on specific procedures and to address new hazards and controls.

### **5.3 DOCUMENTATION**

Documentation of the required training must be maintained in the on-site project files. This documentation will include copies of 40-hr, 8-hr refresher, respirator fit-test certifications, and supervisor training certificates; copies of medical clearance reports; and entries in project logs showing the topics covered, trainer, and signatures of those attending on-site training.

**THIS PAGE INTENTIONALLY LEFT BLANK.**

## 6.0 PERSONAL PROTECTIVE EQUIPMENT

---

PPE for site tasks is based on potential site-specific hazards. In cases where multiple hazards are present, a combination of protective equipment will be selected so that adequate protection is provided for each hazard. When a conflict exists with the PPE requirements, the more restrictive shall apply. This section emphasizes the programmatic requirements for PPE. For task-specific equipment, see Section 3.0 (Hazard/Risk Analysis). All task-specific PPE requirements will be listed in the SSHP Addendum.

### 6.1 PERSONAL PROTECTIVE EQUIPMENT PROGRAM

PPE use must comply with 29 *CFR* 1910, Subpart I and Section 5 of the *USACE Safety and Health Requirements Manual* (USACE 2009). The level of protection and types of materials selected for a particular task must be based on the following:

- Potential for exposure because of work being done;
- Route of exposure;
- Measured or anticipated concentration in the medium of concern;
- Toxicity, reactivity, or other measure of adverse effect; and
- Physical hazards such as falling objects and flying projectiles.

In situations where the type of contamination, concentration, and probability of contact are not known, the appropriate protection is selected based on the Contractor CIH's professional judgment until the hazards are further evaluated.

The Contractor SSHO may raise or lower the level of PPE worn by the teams depending upon the site-specific hazards encountered in the field. Prior to lowering the level of PPE, the Contractor Field Operations Manager and the Contractor CIH must be contacted/consulted and approval given and documented. If site conditions are such that the level of PPE is insufficient or work must be stopped, the Contractor SSHO will take appropriate action immediately, and the appropriate personnel (see above) will be contacted afterwards. The following criteria indicate a possible need for re-assessing the PPE selection:

- Introduction of new types of equipment;
- Commencement of an unplanned (hazard not previously assessed) work phase;
- Working in unplanned temperature extremes;
- Evidence of contamination such as discolored soil or elevated instrument readings near the soil;
- Exceeding the action limits; or
- Changing the work scope so that the degree of contact with contaminants changes.

## 6.2 TYPES OF EQUIPMENT

This section presents the types of protective clothing that may be used for the project. Requirements for task-specific levels of protective clothing are presented in Table 3-2. Levels of protection will be used to protect against chemical and physical hazards at this site are as follows:

- Level C Protective Equipment
  - Full-face respirator and air-purifying cartridges capable of filtering out organic vapors, acid gasses, and radionuclides;
  - Hooded chemical-resistant clothing (polyethylene-coated Tyvek® or equivalent) with all openings taped;
  - Two pairs of chemical-resistant gloves (nitrile and exam gloves);
  - Heavy duty leather, Kevlar, or equivalent gloves (in addition to chemical-resistant gloves) for materials handling or other tasks that pose physical hazards to the hands;
  - Safety boots;
  - Shoe covers; and
  - Hard hat (if overhead hazards are present).
- Level D+ Protective Equipment
  - Tyvek® or equivalent coveralls;
  - Nitrile or polyvinyl chloride gloves;
  - Heavy duty leather, Kevlar, or equivalent gloves (in addition to chemical-resistant gloves) for materials handling or other tasks that pose physical hazards to the hands;
  - Safety boots;
  - Boot covers;
  - Hard hat (if overhead hazards are present); and
  - Safety glasses with side shields.
- Level D Protective Equipment
  - Coveralls/field clothes;
  - Safety boots;
  - Safety glasses with side shields;
  - Hard hat (if overhead hazards are present);
  - Nitrile or equivalent gloves if contaminated materials are handled; and
  - Heavy duty leather, Kevlar, or equivalent gloves (in addition to chemical-resistant gloves) for materials handling or other tasks that pose physical hazards to the hands.

## 6.3 CLEANING, STORAGE, AND PROGRAM VERIFICATION

If site tasks require the use of chemical protective clothing, disposable clothing will be used and will be disposed as project-generated waste in accordance with Section 8.0 of the Facility-Wide Field Sampling Plan (FWFSP) and project-specific addenda. Unused chemical protective clothing will be

- 1 stored in clean staging areas until needed. The Contractor SSHO will verify that the PPE in use is
- 2 appropriate and is being used properly.

**THIS PAGE INTENTIONALLY LEFT BLANK.**

## 7.0 MEDICAL SURVEILLANCE

---

All employees performing on-site hazardous waste-related work will be enrolled in a medical surveillance program to meet the requirements of 29 *CFR* 1910.120(f), 1910.134, 1910.20 and to assess and monitor workers' health and fitness for employment in this field. Employees must be provided with summaries of medical examination results following each examination and must be provided more detailed information upon written request.

### 7.1 FREQUENCY OF EXAM

The frequency of employee medical exams will be as follows:

- Prior to assignment to hazardous waste work that involves potential exposure above occupational exposure limits;
- Once every 12 months for each employee covered unless the attending physician believes a shorter or longer interval (not to exceed 2 years) is appropriate;
- At termination of employment or re-assignment to an area where the employee would not be covered if the employee has performed fieldwork since his/her last examination and has not had an examination within the last 6 months; and
- As soon as possible upon notification by an employee that he/she has developed signs or symptoms indicating possible overexposure to hazardous substances or health hazards, or that the employee has been injured or exposed above the permissible exposure limit or published exposure levels in an emergency situation.

### 7.2 MEDICAL EXAM CONTENT

Medical examinations will include a medical and work history (or updated history if one is available in the employee's file) with special emphasis on symptoms related to the handling of hazardous substances. The examination will determine potential health impairments and fitness for duty, including the ability to wear any required PPE. As a minimum, the exam will include

- Collection of information on the employee's medical and work history;
- Hands-on examination;
- Audiometry;
- Blood screen such as Sequential Multiple Analyzer with Computer 24;
- Chest P/A X-ray at intervals specified by the attending physician;
- Complete blood count;
- Electrocardiogram for persons older than 45 or where medically indicated;
- Physical examination;

- 1       • Spirometry (forced expiratory volume/forced vital capacity); and
- 2       • Urinalysis (dipstick and microscopic).

## 8.0 EXPOSURE MONITORING/AIR SAMPLING PROGRAM

---

Airborne chemical concentrations will be assessed, as appropriate, to ensure exposures do not exceed acceptable levels, as specified in the most recent *Threshold Limits Values and Biological Exposure Indices* or by OSHA, whichever is more stringent. The *USACE Safety and Health Requirement Manual* identifies this more stringent value as the Occupational Exposure Limit (OEL). Action levels, with appropriate actions, will be established by a qualified industrial hygienist or equally competent person for this monitoring, and will be listed in project-specific SSHP addenda to this FWSHP. Monitoring equipment deployment will depend on the activities being conducted and the potential exposures. All monitoring equipment must be approved, inspected, and maintained and calibrated per manufacturer's specifications prior to use. Calibration will be performed by a trained individual and results will be recorded per specifications of Section 06.A.03 of the *USACE Safety and Health Requirement Manual*. All monitoring and analysis must be performed using approved NIOSH or OSHA sampling and analytical methods, as specified in Section 06.A.03 of the *USACE Safety and Health Requirement Manual*. All personal exposure monitoring records will be maintained in accordance with 29 *CFR* 1910.20. Project-specific SSHP addenda will contain the minimum monitoring requirements and action levels for each AOC or investigation as well as engineering controls, work practice controls, and appropriate PPE as needed. If it is determined that no monitoring is necessary, the justification for this determination must be incorporated into project-specific SSHP addenda.

**THIS PAGE INTENTIONALLY LEFT BLANK.**

## 9.0 HEAT/COLD STRESS

---

### 9.1 INCLEMENT WEATHER

When warnings or indications of impending severe weather exist (e.g., heavy rains, thunderstorms, damaging winds, tornados, hurricanes, floods, lightning), the Contractor SSHO will monitor the weather conditions using a weather notification system. Appropriate precautions will be taken to protect personnel and property from the effects of the severe weather. In accordance with Section 6 of the *USACE Safety and Health Requirements Manual* (USACE 2008), project-specific SSHP addenda should include, at a minimum:

- Severe weather triggers to alert the Contractor SSHO to monitor weather conditions;
- Training on severe weather precautions and actions; and
- Identified area of retreat, preferably a substantial building.

### 9.2 HEAT/COLD STRESS MONITORING AND CONTROLS

Acclimatization, consumption of copious quantities of fluids, and appropriate work/rest cycles are important factors in preventing heat stress-induced illnesses. General controls will consist of making fluids readily available, using the buddy system, and taking scheduled and unscheduled breaks in a temperature-controlled environment as necessary. The following specific steps will be taken to reduce the potential for heat stress-induced illness:

- When possible, schedule work for cooler periods during the day.
- Provide site training to include controlling heat stress, recognizing heat stress-induced illness, and administering first aid for heat stress.
- Provide cool Gatorade™, equivalent drink, or water to site workers and encourage their consumption.
- Where employees are exposed to solar radiation for short periods and there is the potential for sunburn, or exposure for prolonged periods where long-term exposure could lead to health effects such as skin cancer, they shall be provided sun screen with a sun protection factor (SPF) appropriate for their skin type and exposure. Sunscreens shall be used only in accordance with the manufacturer's recommendations.
- Instruct workers to monitor their own and their buddy's condition relative to heat stress.
- Develop an initial work/rest cycle based on the site-specific conditions and the capabilities of the work crew. The American Conference of Governmental Industrial Hygienists (ACGIH) heat stress Threshold Limit Value (TLV) will be instituted per Table 9-1.

- Provide a cool environment, such as a vehicle with air conditioning, for breaks.
- Encourage and allow workers to take unscheduled breaks, if needed.

**Table 9-1. Recommended Work/Rest Cycle**

Work-Rest Regimen	Work Load		
	Light	Moderate	Heavy
Continuous work	86 <sup>b</sup>	80	77
45 min work/15 min rest <sup>a</sup>	87	82	78
30 min work/30 min rest	89	85	82
15 min work/45 min rest	90	88	86

<sup>a</sup>Non-work, sitting in the shade or air conditioned area.

<sup>b</sup>Wet bulb globe temperature (WBGT) index expressed in degrees Fahrenheit or standard dry bulb temperature if WBGT is unavailable.

- Monitor workers wearing Tyvek® or other impermeable clothing for heat stress by taking their pulses at the beginning of each rest period. If any worker's heart rate exceeds 110 beats per minute, the next work period will be shortened by one third (NIOSH et al 1985).

Adequate clothing and staying dry are critical factors in preventing cold stress disorders. The SSHO and Field Operations Manager will ensure the capability to quickly move individuals who become wet to a sheltered, warm area. The following specific steps will be taken (adapted from ACGIH 2010).

- If ambient temperatures are less than 40°F, provide site training on preventing cold injury, recognizing cold injury symptoms, and administering cold injury first aid.
- Provide a heated break area if ambient temperatures are less than 32°F.
- Implement breaks in a warm area every 120 min, at a minimum, if ambient temperatures are less than 32°F.
- Allow workers to take unscheduled breaks, if needed, in a warm area.
- Outdoor work will not be performed if the equivalent chill temperature (temperature combined with the effect of wind) is less than -29°F.

### **9.3 HEAT/COLD STRESS-INDUCED ILLNESS SIGNS AND SYMPTOMS**

Heat cramps are caused by heavy sweating and inadequate electrolyte replacement. Signs and symptoms are muscle spasms and pain in the hands, feet, and abdomen. Personnel exhibiting these symptoms should rest in a cool place and consume fluids and salt.

1 Heat exhaustion occurs from increased stress on various body organs. Signs and symptoms are:

- 2
- 3 • Pale, cool, moist skin;
- 4 • Heavy sweating;
- 5 • Dizziness and nausea; and
- 6 • Fainting.
- 7

8 Heat stroke is the most serious form of heat-related illness and should always be treated as a medical  
9 emergency. The body's temperature regulation system fails, and the body temperature rapidly rises to  
10 critical levels. Immediate action must be taken to cool the body before serious injury or death occurs.  
11 Signs and symptoms of heat stroke are:

- 12
- 13 • Red, hot, usually dry skin;
- 14 • Lack of or reduced perspiration;
- 15 • Nausea;
- 16 • Dizziness and confusion;
- 17 • Strong, rapid pulse and confusion; and
- 18 • Coma.
- 19

20 Hypothermia is the uncontrolled loss of body heat. As the body's core temperature decreases, bodily  
21 functions are slowed. The victim becomes weak and disoriented and may become comatose if steps  
22 are not taken to return the core temperature to the normal range. Hypothermia can occur whenever  
23 temperatures are below 45°F and is most common during wet, windy conditions, with temperatures  
24 between 40 and 30°F. The principal cause of hypothermia in these conditions is loss of insulating  
25 properties of clothing due to moisture, coupled with heat loss due to wind and evaporation of  
26 moisture on the skin.

27  
28 Frostbite is the freezing of body tissue, which ranges from superficial freezing of surface skin layers  
29 to deep freezing of underlying tissue. Frostbite will only occur when ambient temperatures are below  
30 32°F. The risk of frostbite increases as the temperature drops and wind speed increases.

**THIS PAGE INTENTIONALLY LEFT BLANK.**

## 10.0 STANDARD OPERATING SAFETY PROCEDURES

---

This section presents general safety rules applicable to the anticipated tasks. The provisions of the plan are mandatory for all on-site employees and visitors, including employees engaged in initial site reconnaissance, preliminary field investigations, mobilization, project operations, and demobilization. These standard operating procedures are offered for guidance. The Contractor will be responsible for ensuring that the appropriate and sufficient procedures presented in project-specific SSHP addenda are used to protect its employees.

### 10.1 SITE RULES

The following rules will apply to all site activities:

- Personnel must maintain contact with Post 1 at all times through two-way radios or phones.
- All work will be conducted in compliance with the *USACE Safety and Health Requirements Manual* (USACE 2008).
- Daily safety briefings (“tailgate”) will be held during field activities to inform personnel of new hazards or procedures.
- The SSHO or Field Operations Manager will conduct and document daily safety inspections.
- Personnel will notify the SSHO of any medical conditions (e.g., allergic to bee stings, diabetes, pregnancy) that require special consideration.
- Personnel will maintain proper workplace housekeeping to minimize the potential for tripping and other accidents.
- Contact with potentially contaminated substances will be avoided. Site personnel in the exclusion zone will avoid walking through puddles, pools, and mud; kneeling on the ground; and placing equipment on the ground.
- Spills will be prevented to the extent possible. If a spill occurs, the material will be contained.
- All injuries and accidents requiring first aid will be reported to the SSHO, Field Operations Manager, Contractor CIH, and the Army Project Manager.
- All workers will abide by a buddy system. Members of a buddy team will maintain verbal or visual contact.

## 10.2 DRIVING

All posted speed limits and state vehicle operation laws must be obeyed at all times. Contractors driving motor vehicles/equipment may not use hand-held cellular phones but may use hands-free telephones while the vehicle is in motion. Prior to using a hand-held cellular phone, drivers shall find a safe place to bring their vehicle to a stop. This requirement does not preclude passenger(s) from using cellular phones while the vehicle is in motion. Using headphones and earphones is prohibited while operating a motor vehicle/equipment.

## 10.3 PERMIT REQUIREMENTS

Contractors will coordinate with RVAAP to obtain, as necessary, all permits necessary for the safe execution of a project, which will include, at a minimum, digging permits/clearance from local utilities prior to any drilling or excavation.

## 10.4 INVESTIGATION-DERIVED WASTE DRUM/CONTAINER HANDLING

Any drums used for the project will meet the requirements of the FWSAP and project-specific addenda. RVAAP Operations and Maintenance Contractor personnel will provide any required fork truck services in the investigation-derived waste (IDW) staging area (Building 1036). IDW movement from field sites to Building 1036 will be conducted by the drilling subcontractor using a backhoe equipped with forks and drum dollies. No personnel will be allowed under lifted loads. Lifts of greater than 50 lb will be made with two or more personnel or with lifting equipment in compliance hazardous waste safety training and Sections 14 and 16 of the *USACE Safety and Health Requirements Manual*.

## 10.5 CONFINED SPACE ENTRY

Confined space entry will conform with the requirements of 29 CFR 1910.146 and Section 34 of the *USACE Safety and Health Requirement Manual*. The minimum applicable requirements are completion of an entry permit, atmospheric testing for oxygen (must be 19.5 to 22%), atmospheric testing for toxic gases (must be less than 5 parts per million [ppm] or the chemical-specific limit), atmospheric testing for flammable gases (must be less than 10% of the lower explosive limit), and stationing an attendant nearby but outside the excavation.

## 10.6 HOT WORK, SOURCES OF IGNITION, AND FIRE PROTECTION

This work will be conducted according to Sections 9 and 10 the *USACE Safety and Health Requirement Manual*.

- Notify Post 1 before hot work activities begin. Such notification includes the location where the hot work will be conducted and the start and stop time of the hot work.

- Use a welder's helmet or shaded goggles, leather gloves, and long-sleeved shirt to conduct hot work (oxyfuel cutting).
- Provide a fire extinguisher, rated not less than 10-ABC, in the immediate vicinity of hot work.
- Keep sources of ignition at least 15.2 m (50 ft) from flammables storage areas.
- Post flammables storage areas with signs indicating "No Smoking or Open Flame."
- Keep at least one fire extinguisher, rated not less than 20-B, 7.6 to 22.9 m (25 to 75 ft) from all flammables storage areas.
- Use an approved flammables cabinet to store 94.6 L or more (25 gal or more) of flammable liquid.
- Keep flammable liquids (other than decontamination solvents) in safety containers with flame arresters.

## **10.7 ELECTRICAL SAFETY**

This work will be conducted according to 29 *CFR* 1910 Subpart S and Section 11 of the *USACE Safety and Health Requirement Manual*.

- Connect all portable 110-V electrical equipment through ground fault circuit interrupters (GFCIs).
- Keep conductive materials (drill rigs) clear of energized power lines. Observe the following minimum distances: 0 to 50 kV (10 ft); 51 to 100 kV (12 ft); 101 to 200 kV (15 ft); 201 to 300 kV (20 ft); 301 to 500 kV (25 ft); 501 to 750 kV (35 ft); and 750 to 1000 kV (45 ft).

## **10.8 EXCAVATION AND TRENCH SAFETY**

Trench excavation potentially poses the following hazards: contact with buried utilities, trench cave-in and engulfment, confined space hazards such as hazardous airborne concentrations of toxic chemicals, flammable concentrations of vapors or gases, and oxygen deficiency. The depth of the excavation and the nature of the excavated material significantly impact the potential hazard—the greater the depth, the greater the hazard.

Prior to opening an excavation, the site will be verified free of underground utilities by contacting the local utility companies and/or appropriate base personnel. Notification will include submitting maps with planned excavation locations clearly marked for appropriate base personnel approval. If underground utilities are present, they will be located and protected from damage or movement.

Other location-specific hazards, such as the potential for UXO, building foundations, and unstable rocks will be controlled.

Cave-in hazards will be controlled by excluding personnel from inside or near (within 3 ft) excavations 5 ft or deeper. This restriction will not be applied to excavations less than 5 ft deep if the SSHO or Field Operations Manager has examined the excavations and determined there is no potential for cave-in.

If personnel must enter trenches deeper than 1.2 m (4 ft), the requirements of 29 *CFR* 1926.651 and Section 25 of the *USACE Safety and Health Requirement Manual* will be applied. This will include daily inspections of the excavation and shoring or sloping the trench sides. Shoring will be accomplished using a trench box with rigid sides to prevent engulfment. If a trench box is not utilized, the trench sides will be sloped at a 34° angle (one and one-half horizontal to one vertical). All spoils will be located at least 0.6 m (2 ft) from the edge of the excavation. Such entry also will be treated as confined space entry and procedures will comply with Section 10.5 (Confined Space Entry).

## **10.9 MACHINE GUARDING**

All equipment will be operated with all guards provided by the manufacturer and in compliance with 29 *CFR* 1910, Subpart O and Section 16.A.11 of the *USACE Safety and Health Requirement Manual*. If any guarding must be removed for servicing, the equipment will be disabled to preclude movement or release of energy.

## **10.10 LOCKOUT/TAGOUT**

All potentially hazardous servicing or equipment repair will be governed by 29 *CFR* 1910.147 and Section 12 of the *USACE Safety and Health Requirement Manual*.

## **10.11 FALL PROTECTION**

Work areas with the potential for a fall of 1.2 m (4 ft) or more will be provided with fall protection in compliance with Section 21.C of the *USACE Safety and Health Requirement Manual*. This fall protection will consist of guardrails or personal fall protection. Personal fall protection will be used if drilling personnel must climb the upright mast or derrick.

## **10.12 HAZARD COMMUNICATION**

Hazard communication will be governed by 29 *CFR* 1910.1200 and Section 06.B of the *USACE Safety and Health Requirement Manual*. At a minimum, the following steps will be taken:

- All hazardous materials on-site will be labeled to comply with the hazard communication standard, and will include the following.

- Clear labeling as to the contents; and
- The appropriate hazard warning.

- MSDSs will be available on-site for all hazardous materials that are present.
- Site-specific training will be provided for the hazards posed by site chemicals, protective measures, and emergency procedures.
- Copies of MSDSs for all hazardous chemicals (chemicals brought on-site) will be maintained in the work area. MSDSs will be available to all employees for review during each work shift.

For all activities where lead control and asbestos disturbance is performed, a separate compliance plan must be written to adequately communicate planned activities and implemented controls. Compliance plans will appear as attachments or appendices to project-specific SSHP addenda and will be consistent with standards in Section 06.B.05 of the *USACE Safety and Health Requirement Manual*.

#### **10.13 ILLUMINATION**

All site fieldwork will be conducted during daylight hours (no earlier than 15 min after sunrise and no later than 15 min before sunset) and natural illumination will be used. Non-fieldwork conducted in buildings will be illuminated to meet the following minimums stated in Section 7 of the *USACE Safety and Health Requirement Manual*: general outdoors - 33 lx, stairs and ladders - 110 lx, offices - 540 lx, and first aid areas - 325 lx.

#### **10.14 SANITATION**

- Sanitation will comply with 29 *CFR* 1910.120(n) and Section 2 of the *USACE Safety and Health Requirement Manual*.
- Provide means at the work site for washing hands and faces prior to eating.
- Provide potable drinking water in closed, labeled (“Drinking Water”), sanitary dispensers and protect them from contamination.
- Post any containers or dispensers of non-potable water with “Caution – Water Unsafe for Drinking, Washing, or Cooking.”
- Provide toilets, except for mobile crews with transportation to adequate facilities, according to the following: 1 to 15 personnel = 1 toilet, 16 to 35 personnel = 2 toilets, 36 to 55 personnel = 3 toilets, and 56 to 80 personnel = 4 toilets. Toilet facilities must be lit,

1 ventilated, and have areas for hand washing per Section 02.E of the *USACE Safety and*  
2 *Health Requirement Manual*.

### 3 4 **10.15 DRILL RIG OPERATIONS**

5  
6 General drilling practices will comply with Section 18H of the *USACE Safety and Health*  
7 *Requirement Manual*.

- 8  
9 • Operating manuals will be present on-site for each type of drill rig in use and rigs will be  
10 operated per the operating manuals.
- 11  
12 • Drill rigs will have at least two functional emergency shutdown devices, one for the driller  
13 and one for the driller's helper. These switches will be confirmed to be functional each day  
14 that the rig will be used and the confirmation will be recorded in the daily task activity log.
- 15  
16 • Drill rigs will have functional backup alarms.
- 17  
18 • Drill rigs will be inspected weekly by the driller and recorded on the weekly drill rig  
19 inspection form; the SSHO will confirm this inspection.
- 20  
21 • Only the driller, driller's helper, and personnel who have a critical need will be allowed near  
22 moving parts of the drill rig.
- 23  
24 • Drill sites will be verified free of underground utilities by clearing each site with local  
25 utilities and/or appropriate installation personnel prior to beginning drilling. Drill sites will  
26 be evaluated for proximity to overhead utilities, and minimum distances will be maintained as  
27 specified in Table 11-1 of the *USACE Safety and Health Requirement Manual*. Notification  
28 will include submitting maps with planned excavation locations clearly marked for  
29 appropriate base personnel approval.
- 30  
31 • Drill-mounted fire-fighting equipment will be inspected monthly, will not be tampered with,  
32 and will not be removed for other than the intended fire-fighting purposes or for servicing.
- 33  
34 • Drilling crews and personnel who work near the drill rig will be trained in the location and  
35 use of the emergency shutdown devices.
- 36  
37 • Drilling will cease during electrical storms or when electrical storms are imminent.
- 38  
39 • If lubrication fittings are not accessible with guards in place, machinery will be stopped and  
40 disabled (locked out or ignition key removed) for oiling and greasing.
- 41  
42 • Work areas and walkways will not be obstructed.
- 43

1 General hoisting operations comply with the *USACE Safety and Health Requirement Manual*.

- 2
- 3 • The derrick (mast) will not be raised unless the area is free of overhead obstructions and far
- 4 enough from power lines (see Section 10.7, Electrical Safety).
- 5
- 6 • The derrick will not be raised until the rig has been blocked, leveled, and chocked.
- 7
- 8 • Rigging equipment for material handling will be checked prior to use on each shift and as
- 9 often as necessary to ensure it is safe. Defective rigging will be removed from service.
- 10
- 11 • A hoisting line with a load imposed will not be permitted to be in direct contact with any
- 12 derrick member or stationary equipment unless it has been specifically designed for line
- 13 contact.
- 14
- 15 • Workers will stand clear of the well bore when any wire line device is being run.
- 16
- 17 • No loads will be lifted over workers.
- 18
- 19 • Drill rods will not be run or rotated through rod slipping devices. No more than 1 ft of drill
- 20 rod column will be hoisted above the top of the drill mast.
- 21

## 22 **10.16 MUNITIONS AND EXPLOSIVES OF CONCERN**

23

24 Work that involves, or may involve, exposure to MEC will comply with Section 33 of the *USACE*

25 *Safety and Health Requirement Manual*. The Contractor, at a minimum, will follow the procedures

26 listed below for work in all areas at RVAAP. For work within MRSs (Figure 1-1) or in other areas

27 where MEC hazards may reasonably be expected (e.g., former ordnance disposal sites), MEC

28 avoidance protocols will be included in the SSHP addendum, as discussed below, and qualified UXO

29 personnel will support the field investigation. UXO personnel will survey the area (visually and

30 instrument-assisted) prior to work, establish appropriate controls, and accompany field teams during

31 project execution. Environmental work may be conducted in association with an activity requiring an

32 Explosives Safety Submission (ESS). In this event, the SSHP addendum will reference the ESS and

33 field investigation activities must be performed in accordance with all applicable ESS requirements.

34

- 35 • All on-site workers will be trained to recognize and avoid the types of MEC that may be
- 36 present.
- 37
- 38 • Contractors and their subcontractors will not handle, move, or otherwise disturb MEC or any
- 39 items that cannot be identified as non-MEC without specific authorization from Army.
- 40
- 41 • If MEC or potential MEC is discovered, work will be stopped and the area evacuated and
- 42 cordoned off.
- 43

- If MEC or potential MEC is discovered, the RVAAP Facility Manager, Army Project Manager, and security organization will be notified immediately.

The *Site Inspection Report for the Ravenna Army Ammunition Plant, Ohio, Military Munitions Response Program, Site Inspection Munitions Response Sites* conducted by engineering-environment Management in 2008 identified MRS throughout the installation. These sites are suspected or believed to contain MEC. When sampling within an MRS, Contractors will follow the requirements in Chapter 5 of USACE Engineering Pamphlet 75-1-2 (USACE 2004b) and previously agreed to protocols at RVAAP. In general, MEC avoidance is conducted as follows:

- Contractors will be escorted by the UXO Technician at all times within MRSs until the UXO Technician has completed a visual and magnetometer survey of access routes, work areas, and sampling locations and all cleared areas are marked. Whites XLT magnetometers or Schonstedt Model MG-220/230 Magnetic Gradiometers (or equivalent) normally will be used as the unit is designed to detect the presence of buried iron or steel objects. The unit responds when the magnetic field strength at the two sensors located in the sensor assembly is different.
- Escorted personnel will follow behind the UXO Technician. If anomalies or MEC are detected, the UXO Technician will halt escorted personnel in place, mark the item(s), select a course around the item, and instruct escorted personnel to follow. The anomaly will be reported to the on-site Field Operations Manager, who will initiate the appropriate response actions.
- Cleared access routes will be at least twice as wide as the widest vehicle entering the MRS. At a minimum, the cleared work area will be a square, with a side dimension equal to twice the length of the largest vehicle or piece of equipment for use on-site.
- The UXO Technician will use a hand-held magnetometer to clear an area prior to soil sampling/well drilling operations commencing. At not more than a 2-ft depth, a Forster Ferex, MK 26 ordnance locator or Schonstedt-down-hole instrument will be lowered into the soil sampling hole. This procedure ensures that smaller items of MEC, undetectable from the surface, can be detected. If no magnetic anomalies are located, the procedure will be repeated at 2-ft intervals to the maximum depth of the sample to be taken. Anomaly avoidance for groundwater monitoring wells and test pits will be conducted in 2-ft intervals to a depth of 10 ft or encountering bedrock, whichever occurs first.

## **10.17 HISTOPLASMOSIS**

Histoplasmosis is an infectious disease caused by inhaling the spores of a fungus called *Histoplasma capsulatum*. Histoplasmosis is not contagious; it cannot be transmitted from an infected person or animal to someone else. Histoplasmosis primarily affects a person's lungs, and its symptoms vary greatly. The vast majority of infected people are asymptomatic (have no apparent ill effects) or they

1 experience symptoms so mild they do not seek medical attention and may not even realize that their  
2 illness was histoplasmosis. If symptoms do occur, they will usually start within 3 to 17 days after  
3 exposure, with an average of 10 days. Histoplasmosis can appear as a mild, flu-like respiratory  
4 illness and has a combination of symptoms, including malaise (a general ill feeling), fever, chest pain,  
5 dry or non-productive cough, headache, loss of appetite, shortness of breath, joint and muscle pains,  
6 chills, and hoarseness. Chronic lung disease due to histoplasmosis resembles tuberculosis and can  
7 worsen over months or years. Special antifungal medications are needed to arrest the disease.

8 *H. capsulatum* grows in soil throughout the world. In the United States, the fungus is endemic (more  
9 prevalent) and the proportion of people infected by *H. capsulatum* is higher in central and eastern  
10 states, especially along the valleys of the Ohio, Mississippi, and St. Lawrence Rivers and the  
11 Rio Grande. The fungus seems to grow best in soil having a high nitrogen content, especially that  
12 enriched with bat droppings or bird manure. Disturbances of contaminated material cause small  
13 *H. capsulatum* spores to become airborne or aerosolized.

14 The following actions must be taken to minimize the potential for infection:

- 15
- 16 • Workers who will disturb collections of bird or bat droppings must be trained in the potential  
17 hazard and control measures.
- 18
- 19 • Avoid disturbing collections of bird or bat droppings in any way that causes airborne dust.
- 20
- 21 • If collections of bird or bat droppings will be disturbed, wet droppings with water and  
22 surfactant before disturbing and continuously during disturbance.
- 23
- 24 • Stop work and take additional corrective action if visible airborne dust is observed.
- 25
- 26 • Use particulate respirators and disposable coveralls for work that may involve potentially  
27 significant or uncontrolled exposure to collections of droppings.
- 28

## 29 **10.18 LYME DISEASE**

30

31 Lyme disease is an infection caused by the corkscrew-shaped bacteria *Borrelia burgdorferi* that is  
32 transmitted by the bite of deer (*Ixodes scapularis*) and western black-legged (*Ixodes pacificus*) ticks.  
33 The deer tick, which normally feeds on the white-footed mouse, the white-tailed deer, other  
34 mammals, and birds, is responsible for transmitting Lyme disease bacteria to humans in the  
35 northeastern and north-central United States. On the Pacific Coast, the bacteria are transmitted to  
36 humans by the western black-legged tick. *Ixodes* ticks are much smaller than common dog and cattle  
37 ticks. In their larval and nymphal stages, they are no bigger than a pinhead. Adult ticks are slightly  
38 larger.

39

40 Ticks search for host animals from the tips of grasses and shrubs (not from trees) and transfer to  
41 animals or persons that brush against vegetation. Ticks only crawl; they do not fly or jump. Ticks  
42 found on the scalp usually have crawled there from lower parts of the body. Ticks can attach to any  
43 part of the human body but often attach to the more hidden and hairy areas such as the groin, armpits,

1 and scalp. Research in the eastern United States has indicated that, for the most part, ticks transmit  
2 Lyme disease to humans during the nymph stage, probably because nymphs are more likely to feed  
3 on a person and are rarely noticed because of their small size. Thus, the nymphs typically have ample  
4 time to feed and transmit the infection (ticks are most likely to transmit infection after approximately  
5 2 or more days of feeding). Adult ticks can transmit the disease, but since they are larger and more  
6 likely to be removed from a person's body within a few hours, they are less likely than the nymphs to  
7 have sufficient time to transmit the infection.

8  
9 The following control measures must be followed:

- 10  
11 • Whenever possible, avoid entering areas that are likely to be infested with ticks, particularly  
12 in spring and summer when nymphal ticks feed. Ticks favor a moist, shaded environment,  
13 especially that provided by leaf litter and low-lying vegetation in wooded, brushy, or  
14 overgrown grassy habitat.
- 15  
16 • Wear light-colored clothing so that ticks can be spotted more easily and removed before  
17 becoming attached.
- 18  
19 • Wear long pants and tuck pant legs into socks or boot tops or close the pant legs with tape or  
20 other means.
- 21  
22 • Apply insect repellents containing n,n-diethyl-m-toluamide (DEET) to clothes and exposed  
23 skin.
- 24  
25 • If personnel must enter areas with known heavy infestation, consider applying permethrin  
26 (which kills ticks on contact) to clothes.
- 27  
28 • Conduct daily checks for ticks. Embedded ticks should be removed using fine-tipped  
29 tweezers. DO NOT use petroleum jelly, a hot match, nail polish, or other products. Grasp  
30 the tick firmly and as closely to the skin as possible. With a steady motion, pull the tick's  
31 body away from the skin. The tick's mouthparts may remain in the skin, but do not be  
32 alarmed. The bacteria that cause Lyme disease are contained in the tick's midgut. Cleanse  
33 the area with an antiseptic.
- 34  
35 • Note the date of removal of any imbedded tick and seek medical attention if any signs and  
36 symptoms of early Lyme disease, Ehrlichiosis, or Babesiosis develop over the ensuing days  
37 or weeks.

## 38 39 **10.19 ROCKY MOUNTAIN SPOTTED FEVER**

40  
41 Rocky Mountain Spotted Fever is a rickettsial disease caused by the organism *Rickettsia rickettsii*. It  
42 is transmitted by the bite of an infected tick and results in a systemic, febrile illness. Several ticks are  
43 responsible for the spread of this disease, and these vary by geographic region. The dog tick,

1 *Dermacentor variabilis*, is probably the most common vector. According to the Ohio Department of  
2 Health, the incidence of Rocky Mountain Spotted Fever has increased in recent years.

3  
4 The organism becomes infectious after the tick has been attached to the skin for at least 4 to 6 hr. It  
5 can also be transmitted in the process of tick removal if the tick is crushed, which allows infectious  
6 material to escape.

7  
8 Symptoms of Rocky Mountain Spotted Fever include the sudden onset of a moderate to high fever  
9 (which can last 2 to 3 weeks if untreated), muscle pain, severe headache, and chills. A rash occurs in  
10 about half of the cases. It starts with the extremities and soon spreads to the palms of the hands and  
11 soles of the feet, then quickly spreads to the trunk and rest of the body.

12  
13 Control measures are the same as those for Lyme disease ticks.

## 14 15 **10.20 MOSQUITO-BORNE VIRUSES**

16  
17 According the Center for Disease Control, West Nile Virus (WNV) is a potentially serious illness.  
18 Experts believe WNV is established as a seasonal epidemic in North America that flares up in the  
19 summer and continues into the fall. Most often, WNV is spread by the bite of an infected mosquito.  
20 Mosquitoes become infected when they feed on infected birds. Infected mosquitoes can then spread  
21 WNV to humans and other animals when they bite. The easiest and best way to avoid WNV is to  
22 prevent mosquito bites.

- 23  
24 • When outdoors, use insect repellent containing an United States Environmental Protection  
25 Agency (USEPA)-registered active ingredient. Follow the directions on the package.  
26  
27 • Many mosquitoes are most active at dusk and dawn. Be sure to use insect repellent and wear  
28 long sleeves and pants at these times or consider staying indoors during these hours.

29  
30 About 1 in 150 people infected with WNV will develop severe illness. The severe symptoms can  
31 include high fever, headache, neck stiffness, stupor, disorientation, coma, tremors, convulsions,  
32 muscle weakness, vision loss, numbness, and paralysis. These symptoms may last several weeks, and  
33 neurological effects may be permanent. Up to 20% of the people who become infected have  
34 symptoms such as fever, headache, body aches, nausea, vomiting, and sometimes swollen lymph  
35 glands or a skin rash on the chest, stomach, and back. Symptoms can last for as short as a few days;  
36 although, even healthy people have become sick for several weeks. Approximately 80% of people  
37 (about four out of five) who are infected with WNV will not show any symptoms at all. People  
38 typically develop symptoms between 3 and 14 days after they are bitten by the infected mosquito  
39 (CDC 2006).

## 10.21 IONIZING RADIATION

All work involving regulated radiation sources must be conducted in accordance with the requirements of the *USACE Safety and Health Requirements Manual*, Section 06.E, Ionizing Radiation (USACE 2008). Requirements include, but are not limited to:

- United States Department of Defense Form 3337, Application for Army Radiation Authorization, must be completed and approved by RVAAP prior to bringing a source onto RVAAP.
- All regulatory requirements, including source security, must be met during the period the source is on RVAAP.
- RVAAP must be notified when the source is removed.

## 10.22 FUELS

RVAAP procedures and applicable portions of Section 9 of the *USACE Safety and Health Requirements Manual* for use and storage of fuels, such as gasoline and diesel fuel, must be followed. These include, but are not limited to:

- Secondary containment for containers with a capacity of 100 gal or more;
- All spills must be immediately reported to RVAAP;
- Spill response must comply with the current Installation Spill Contingency Plan for RVAAP;
- Fuel storage areas will be posted with signs stating “No Smoking, Matches, or Open Flame,” and no ignition sources will be allowed within 50 ft.
- Only labeled/listed (by a nationally recognized testing laboratory) containers and portable tanks will be used for the storage of flammable and combustible liquids.

## 11.0 SITE CONTROL MEASURES

---

The Field Operations Manager will be responsible for establishing the site control zones, as necessary, around Contractor-controlled areas that present physical or chemical hazards. Implementation of the site control zones will help to minimize the number of employees potentially exposed and to minimize the potential for the spread of contamination. The SSHO will monitor the implementation of the required site control work rules and will report any deviations from prescribed practice to the Field Operations Manager or stop work, as appropriate.

Most AOCs are in remote locations with limited activity. An exclusion zone may not be practical at these locations. The SSHO will be responsible for determining the need for establishing site controls and exclusion zones. An exclusion zone will be established if the work site will be left intact and unattended for an extended period of time (e.g., leaving an open excavation or drill rig in place overnight). If the SSHO determines that a potential exists for unauthorized personnel to approach within 25 ft of a work zone or otherwise be at risk due to proximity, then exclusion zones will be established as described in the following sections.

### 11.1 EXCLUSION ZONE

The exclusion (contamination) zone is the area where the greatest potential exists for exposure to contamination or physical hazards. The periphery of the exclusion zone will be identified by barricade tape or rope suspended above the ground. An entry and exit checkpoint will be visually defined to regulate the flow of personnel and equipment. The entry and exit checkpoint will be delineated with barricade tape/rope and signs. Signs may state "Construction Area," or "High Noise Area," as deemed appropriate by the SSHO. The number of people and equipment in the exclusion zone will be minimized to control physical hazards and the spread of contamination.

The following standard rules will apply to all entry into the exclusion zone:

- The SSHO or Field Operations Manager must approve (and log) entry into the exclusion zone.
- All personnel entering the exclusion zone will wear the prescribed level of protective clothing.
- All items and related paraphernalia intended to be placed on the face or in the mouth (e.g., cigarettes, lighters, matches, chewing tobacco, food, cosmetics) are prohibited in the exclusion zone.
- All personnel in the exclusion zone will follow the buddy system.

1 Exclusion zones will be established around drilling sites, areas of heavy equipment use, and all  
2 activities where contamination is a potential hazard. As a minimum, the exclusion zone will extend  
3 25 ft from the hazard. For drilling operations, the exclusion zone will also be at least equal to the  
4 mast height in radius so that no part of an overturned drill rig will fall outside the zone. A larger  
5 exclusion zone will be used, as necessary, to protect bystanders and the public from chemical or other  
6 hazards. Exclusion zones for other activities will be appropriate to the hazard and surroundings.

## 8 **11.2 CONTAMINATION REDUCTION ZONE**

10 A contamination reduction (buffer) zone will be established, as necessary, outside the exclusion zone  
11 to provide a transition from and a buffer between the exclusion zone and the support zone. A formal  
12 contamination reduction zone for personnel will not be established unless Level D+ PPE or higher  
13 level (A, B, C) is used or significant surface contamination is present or suspected. An entry and exit  
14 checkpoint will be visually defined at the periphery of the zone to regulate the flow of personnel and  
15 equipment. The entry and exit checkpoint and the perimeter of the zone will be delineated with the  
16 use of ropes/barricade tape and signs. A contamination reduction zone will be established around the  
17 central equipment decontamination pad.

19 All personnel entering the contamination reduction zone will wear the prescribed level of protective  
20 clothing required for that zone. All items intended to be placed on the face or in the mouth  
21 (e.g., cigarettes, chewing tobacco, food, cosmetics) are prohibited in the contamination reduction  
22 zone. Doffing of protective clothing and personnel decontamination will occur in the contamination  
23 reduction zones.

## 25 **11.3 SUPPORT ZONE**

27 The support zone is the clean and relatively safe area surrounding the exclusion and contamination  
28 reduction zones. Entry requirements for the support zone consist of those required for entry into the  
29 general area of the facility. Primary functions of the support zone are

- 31 • Staging area for clean equipment and supplies; and
- 33 • Location for support services (e.g., office trailers, laboratory trailers, eating area[s], toilet  
34 facilities, parking, visitor area[s]).

## 36 **11.4 SITE VISITORS**

38 The Field Operations Manager will add all employees/visitors to the on-site access roster that is  
39 maintained by the RVAAP Operations and Maintenance (O&M) Contractor. The O&M Contractor  
40 will approve and coordinate site access with Guard Post 1. All visitors are required to sign-in with  
41 Guard Post 1 to gain site access. Visitors will not be allowed inside areas controlled by the  
42 Contractor without specific approval of the SSHO and Field Operations Manager. Visitors must meet  
43 all regulatory (specifically 29 *CFR* 1910.120) and site health and safety requirements (e.g., proof of

1 training, medical surveillance) to be considered for RVAAP entry. All visitors will receive a health  
2 and safety briefing appropriate to the nature of the visit and the potential hazards associated with the  
3 visit. All visitors must sign the daily tailgate and health and safety briefing form (Appendix A).

#### 4 5 **11.5 SITE COMMUNICATION**

6  
7 Field personnel will be capable of contacting other field personnel and outside agencies.  
8 Communication on-site will be assured by hand-held radio, cellular phone, portable air horns, or  
9 vehicle horns. Short blasts (less than 1/2 sec) of an air horn or car horn will be used to request  
10 assistance. Prolonged blasts (more than 2 sec) will be used to signal an evacuation. If phone service  
11 is not immediately available on the site, the crew will be equipped with a cellular phone.

**THIS PAGE INTENTIONALLY LEFT BLANK.**

## 12.0 PERSONNEL HYGIENE AND DECONTAMINATION

---

A system of procedures will be used to control the spread of contamination from the exclusion (contamination) zone and to ensure that workers are sufficiently free of contamination to preclude adverse health effects. PPE doffing and personnel decontamination are part of this system. The SSHO will ensure the construction of a decontamination station, as necessary; instruct personnel on its proper use; and verify that personnel follow the appropriate steps. This section presents examples of basic requirements for personnel decontamination keyed to the level of protective clothing in use. It is the SSHO's responsibility to verify that personnel hygiene and decontamination processes are adequate to protect personnel and meet the requirements of Sections 06.M and 28 of the *USACE Safety and Health Requirements Manual* (USACE 2008).

### 12.1 LEVEL D+ PROTECTION DECONTAMINATION

Station 1: Tape removal

Remove all tape (if used) from outer clothing and place in appropriate waste container.

Station 2: Boot covers, outer disposable garment, and chemical-resistant gloves removal

Carefully remove boot covers, outer contamination-resistant garment, and gloves.

Station 3: Field wash

Wash hands and face prior to eating, drinking, or smoking. This step may be accomplished with soap and water or disposable disinfectant wipes.

### 12.2 LEVEL C PROTECTION DECONTAMINATION

Station 1: Segregated equipment drop

Deposit equipment used on-site (e.g., tools, sampling devices, containers, monitoring instruments, clipboards) on plastic sheets or in different containers with plastic liners. Segregating the equipment at the drop site reduces the possibility of cross-contamination.

Station 2: Outer boot and glove removal

Remove tape from outer boots and outer gloves. Remove outer boot covers and outer gloves. Deposit gloves and boot covers in plastic trash bags.

1 Station 3: Cartridge change

2  
3 If a worker has left the exclusion zone for the sole purpose of changing a canister/cartridge of the  
4 respirator, this is the last step of the decontamination procedure. Once the worker's canister/cartridge  
5 has been replaced, the outer boots and gloves will be replaced and re-taped so that all potential  
6 pathways to the skin are sealed.

7  
8  
9 Station 4: Disposable outer garment removal

10  
11 Remove the disposable outer garment, deposit in a plastic trash bag, and dispose of it in accordance  
12 with the FWSAP.

13  
14  
15 Station 5: Respiratory protection and disposable inner glove removal

16  
17 The respirator is the next-to-last item for removal. The cartridges/canisters are placed in a plastic  
18 trash bag and disposed of in accordance with the FWSAP. The respirator is placed in a plastic bag  
19 dedicated for used respirators only. Disposable inner gloves are the last item removed; deposit them  
20 in a plastic trash bag in accordance with the FWSAP.

21  
22  
23 Station 6: Field wash

24  
25 Wash hands and face prior to eating, drinking, or smoking. This step may be accomplished with soap  
26 and water or disposable disinfectant wipes.

## 13.0 EMERGENCY PROCEDURES AND EQUIPMENT

---

The Contractor must establish sufficient emergency procedures and equipment to allow a safe and effective response to credible emergencies. If an emergency occurs, the Field Operations Manager, the SSHO, and the field team will participate in a post-emergency briefing to discuss the event, identify the causes, identify corrective measures, and evaluate the responses.

In the event of an accident or incident, the Field Operations Manager must first notify Guard Post 1 ([330] 358-2017) who will coordinate the response. The Field Operations Manager should then notify the USACE Project Manager immediately according to the requirements of the *USACE Safety and Health Requirements Manual* (USACE 2008). The required Accident Report (ENG Form 3394) must be completed and submitted to the USACE Project Manager within 2 days.

All personnel working on-site will be trained in the applicable emergency response requirements. This includes recognizing emergencies, reporting emergencies to the Field Operations Manager or SSHO, and responding to emergencies. Employees will also be informed of any changes in potential emergencies or response plans.

### 13.1 POTENTIAL EMERGENCIES

Credible potential emergencies for this work include fires, minor chemical spills, and personnel injury.

#### 13.1.1 Fires

Small quantities of flammable solvents [typically less than 18.9 L (5 gal)], gasoline, and diesel fuel may be present on-site. In the event of a fire, Guard Post 1 will be notified immediately. If it is safe to do so, on-site personnel may attempt to extinguish the fire with the available fire extinguishers and isolate any nearby flammable materials. If there is any doubt about the safety of extinguishing the fire, site personnel will evacuate the area. The supervisor or knowledgeable employee will provide the Guard Post 1 with relevant information when they arrive.

#### 13.1.2 Spills

Potential spills include releases of fuels, lubricants, hydraulic fluids, and decontamination solvents. In the event of a spill or leak, the employee making the discovery will immediately notify the SSHO and/or the Field Operations Manager. The Field Operations Manager will determine whether the leak poses an environmental risk or will exceed the capacity of on-site personnel and equipment. In the unlikely event that there is a probability that the spill will extend beyond the immediate area, result in an environmental insult, or exceed the capabilities of the on-site personnel, the Field Operations Manager will inform Guard Post 1. If this is not the case, the on-site spill kit will be utilized to clean up the spill.

### 13.1.3 Medical Emergencies

Field crews will use a variety of equipment that could cause injuries. In the event of a medical emergency, the Field Operations Manager will notify Guard Post 1. At least two first aid/ CPR-trained individuals will be on-site at all times, and these personnel will provide first aid pending release of the injured person to emergency medical staff. Automated External Defibrillators are located at Building 1037 and Guard Post 1. Contaminated injured personnel will be decontaminated to the extent feasible. Personnel with minor injuries will follow normal decontamination procedures. Personnel with serious injuries will be decontaminated, if necessary, by disrobing and wrapping in a blanket. Decontamination may be bypassed in the event of life-threatening injuries or illnesses.

### 13.2 EMERGENCY PHONE NUMBERS

Table 13-1 lists the emergency groups and their telephone numbers. A telephone and two-way radio will be present in the field and available for use at all times. All emergencies on-site will be coordinated first through Guard Post 1 ([330] 358-2017) who will coordinate the response.

At least one person (i.e., Contractor Project Manager or Field Operations Manager) must have a working two-way radio on the RVAAP frequency. The radio must be tested each morning before the start of work by radioing Security with a communication check. Each team must have direct radio or telephone communication with the Project Manager or Field Operations Manager. For the purposes of this requirement, a team is any individual(s) not having a line of sight or within normal voice range of another individual(s) having means of communication with the Field Operations Manager.

**Table 13-1. Emergency Contact Phone Numbers**

Position	Phone
RVAAP Guard Post 1 (Police, Fire, Emergency Medical)	(330) 358-2017
Hospital (Robinson Memorial, Ravenna)	(330) 297-2449/0811
RVAAP Facility Manager (Currently) Mark Patterson	(330) 358-7311
RVAAP Operation and Maintenance Contractor (Currently) Jim McGee, Vista Sciences	(330) 358-3005
USACE COTR TBD	TBD
Ohio EPA (Currently) Eileen Mohr	(330) 963-1221
Contractor Project Manager TBD	TBD
Contractor Health and Safety Personnel TBD	TBD

COTR = Contracting Officer's Technical Representative. TBD = To be determined.  
Ohio EPA = Ohio Environmental Protection Agency. USACE = United States Army Corps of Engineers.  
RVAAP = Ravenna Army Ammunition Plant.

Robinson Memorial Hospital is located approximately 32 km (20 miles) from the site at 6847 N. Chestnut Street in Ravenna, Ohio. It can be reached by taking Highway 5 E approximately 11 km (7 miles), Highway 5 approximately 3.2 km (2 miles), Highway 59, then right onto Highway 44 (Chestnut Street). Figure 13-1 contains a map and directions to Robinson Memorial Hospital.

### 13.3 EMERGENCY ALERTING

In the event of an emergency, contact Guard Post 1 through the two-way radio or call ([330] 358-2017). If these attempts fail, additional emergency alerting procedures are as follows. Each team will have a means for generating an audible alarm, which will consist of a compressed gas horn or vehicle horn. These devices will be used to signal to other project personnel in the event of accidents or emergencies. Short blasts (less than 1/2 sec) of the horn will be used to request assistance, while extended blasts (more than 2 sec) will signal an evacuation.

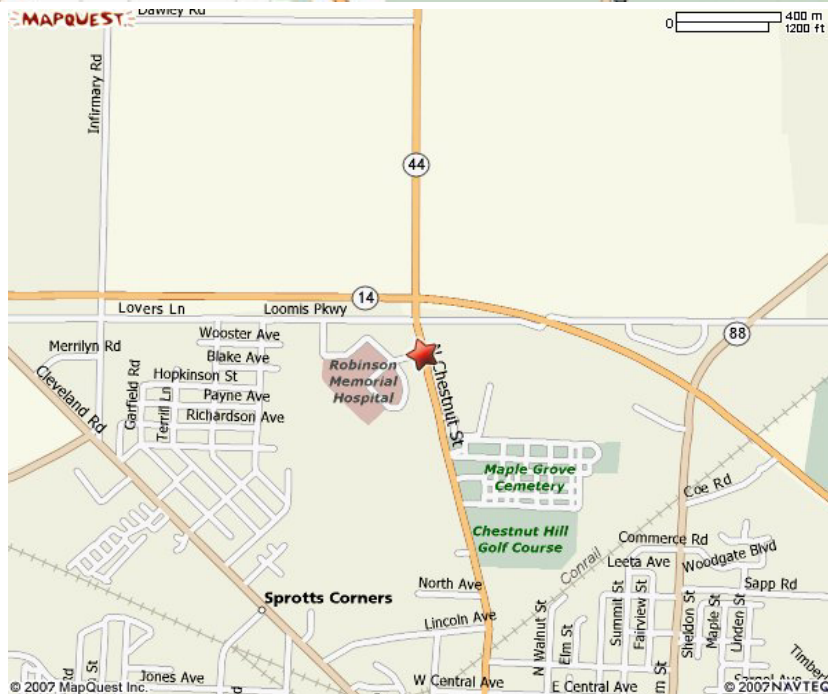

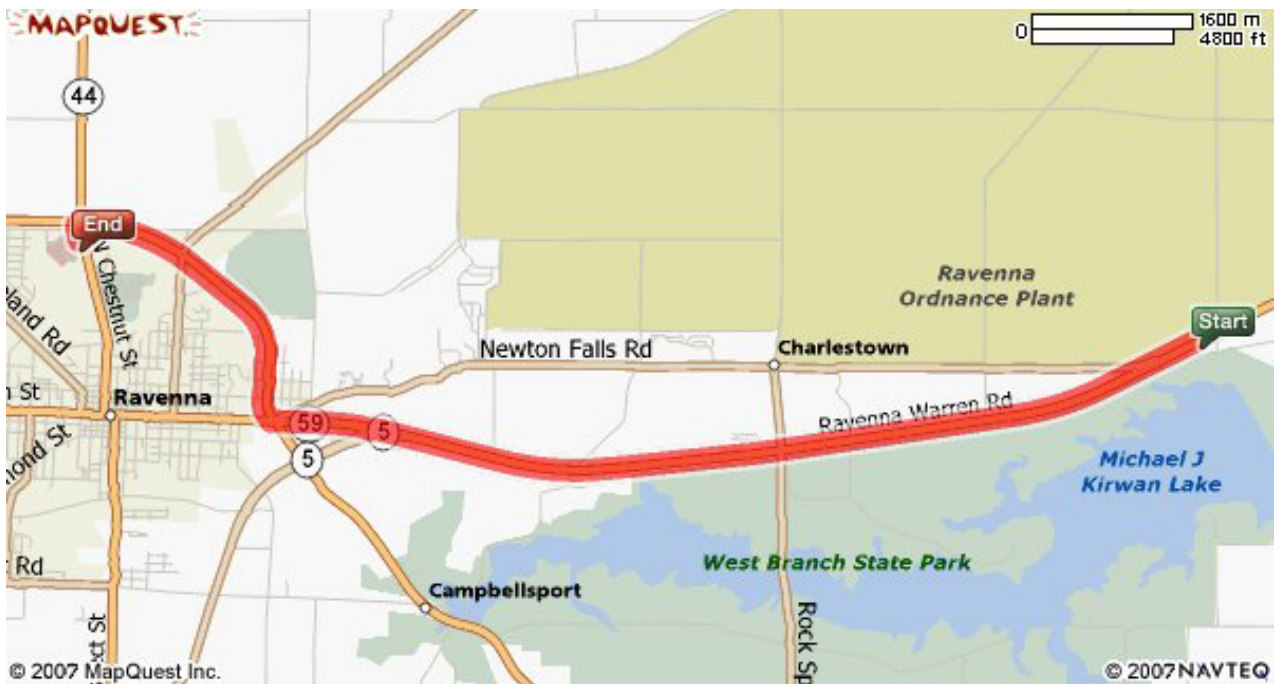

### 13.4 EVACUATION

The FWSHP project-specific addenda must contain a map that illustrates assembly points and egress routes from each AOC included in the investigation. The SSHO or Field Operations Manager will inform all employees of the designated evacuation routes and assembly area. The Facility-wide assembly point is Guard Post 1 as indicated on Figure 13-2.

### 13.5 EMERGENCY EQUIPMENT

Several items of emergency equipment will be maintained at the work site. Any incident that is not clearly controllable by personnel wearing standard site clothing plus protective gloves and using the listed equipment will require re-evaluation by the SSHO. If the SSHO does not feel that on-site personnel can safely control the emergency with the available equipment, the crew will use an alternate approach such as allowing a small fire to burn out or evacuating the site. The required emergency equipment includes the following:

- Fully stocked first aid kit indoors or in a weather-proof container, inspected weekly;
- Compressed gas horns;
- Emergency eye wash to meet American National Standards Institute standard if corrosives (water sample preservatives) are being poured;
- Fire extinguisher(s) (at least 20-B) 7.6 to 22.9 m (25 to 75 ft) from outside the flammables storage (or use) area;
- Basic spill kit suitable to handle small spills of decontamination fluids, hydraulic fluid, or fuels and containing sorbent pads, tubes, and nitrile or similar gloves; and
- Telephone and two-way radios.

**Robinson Memorial Hospital**

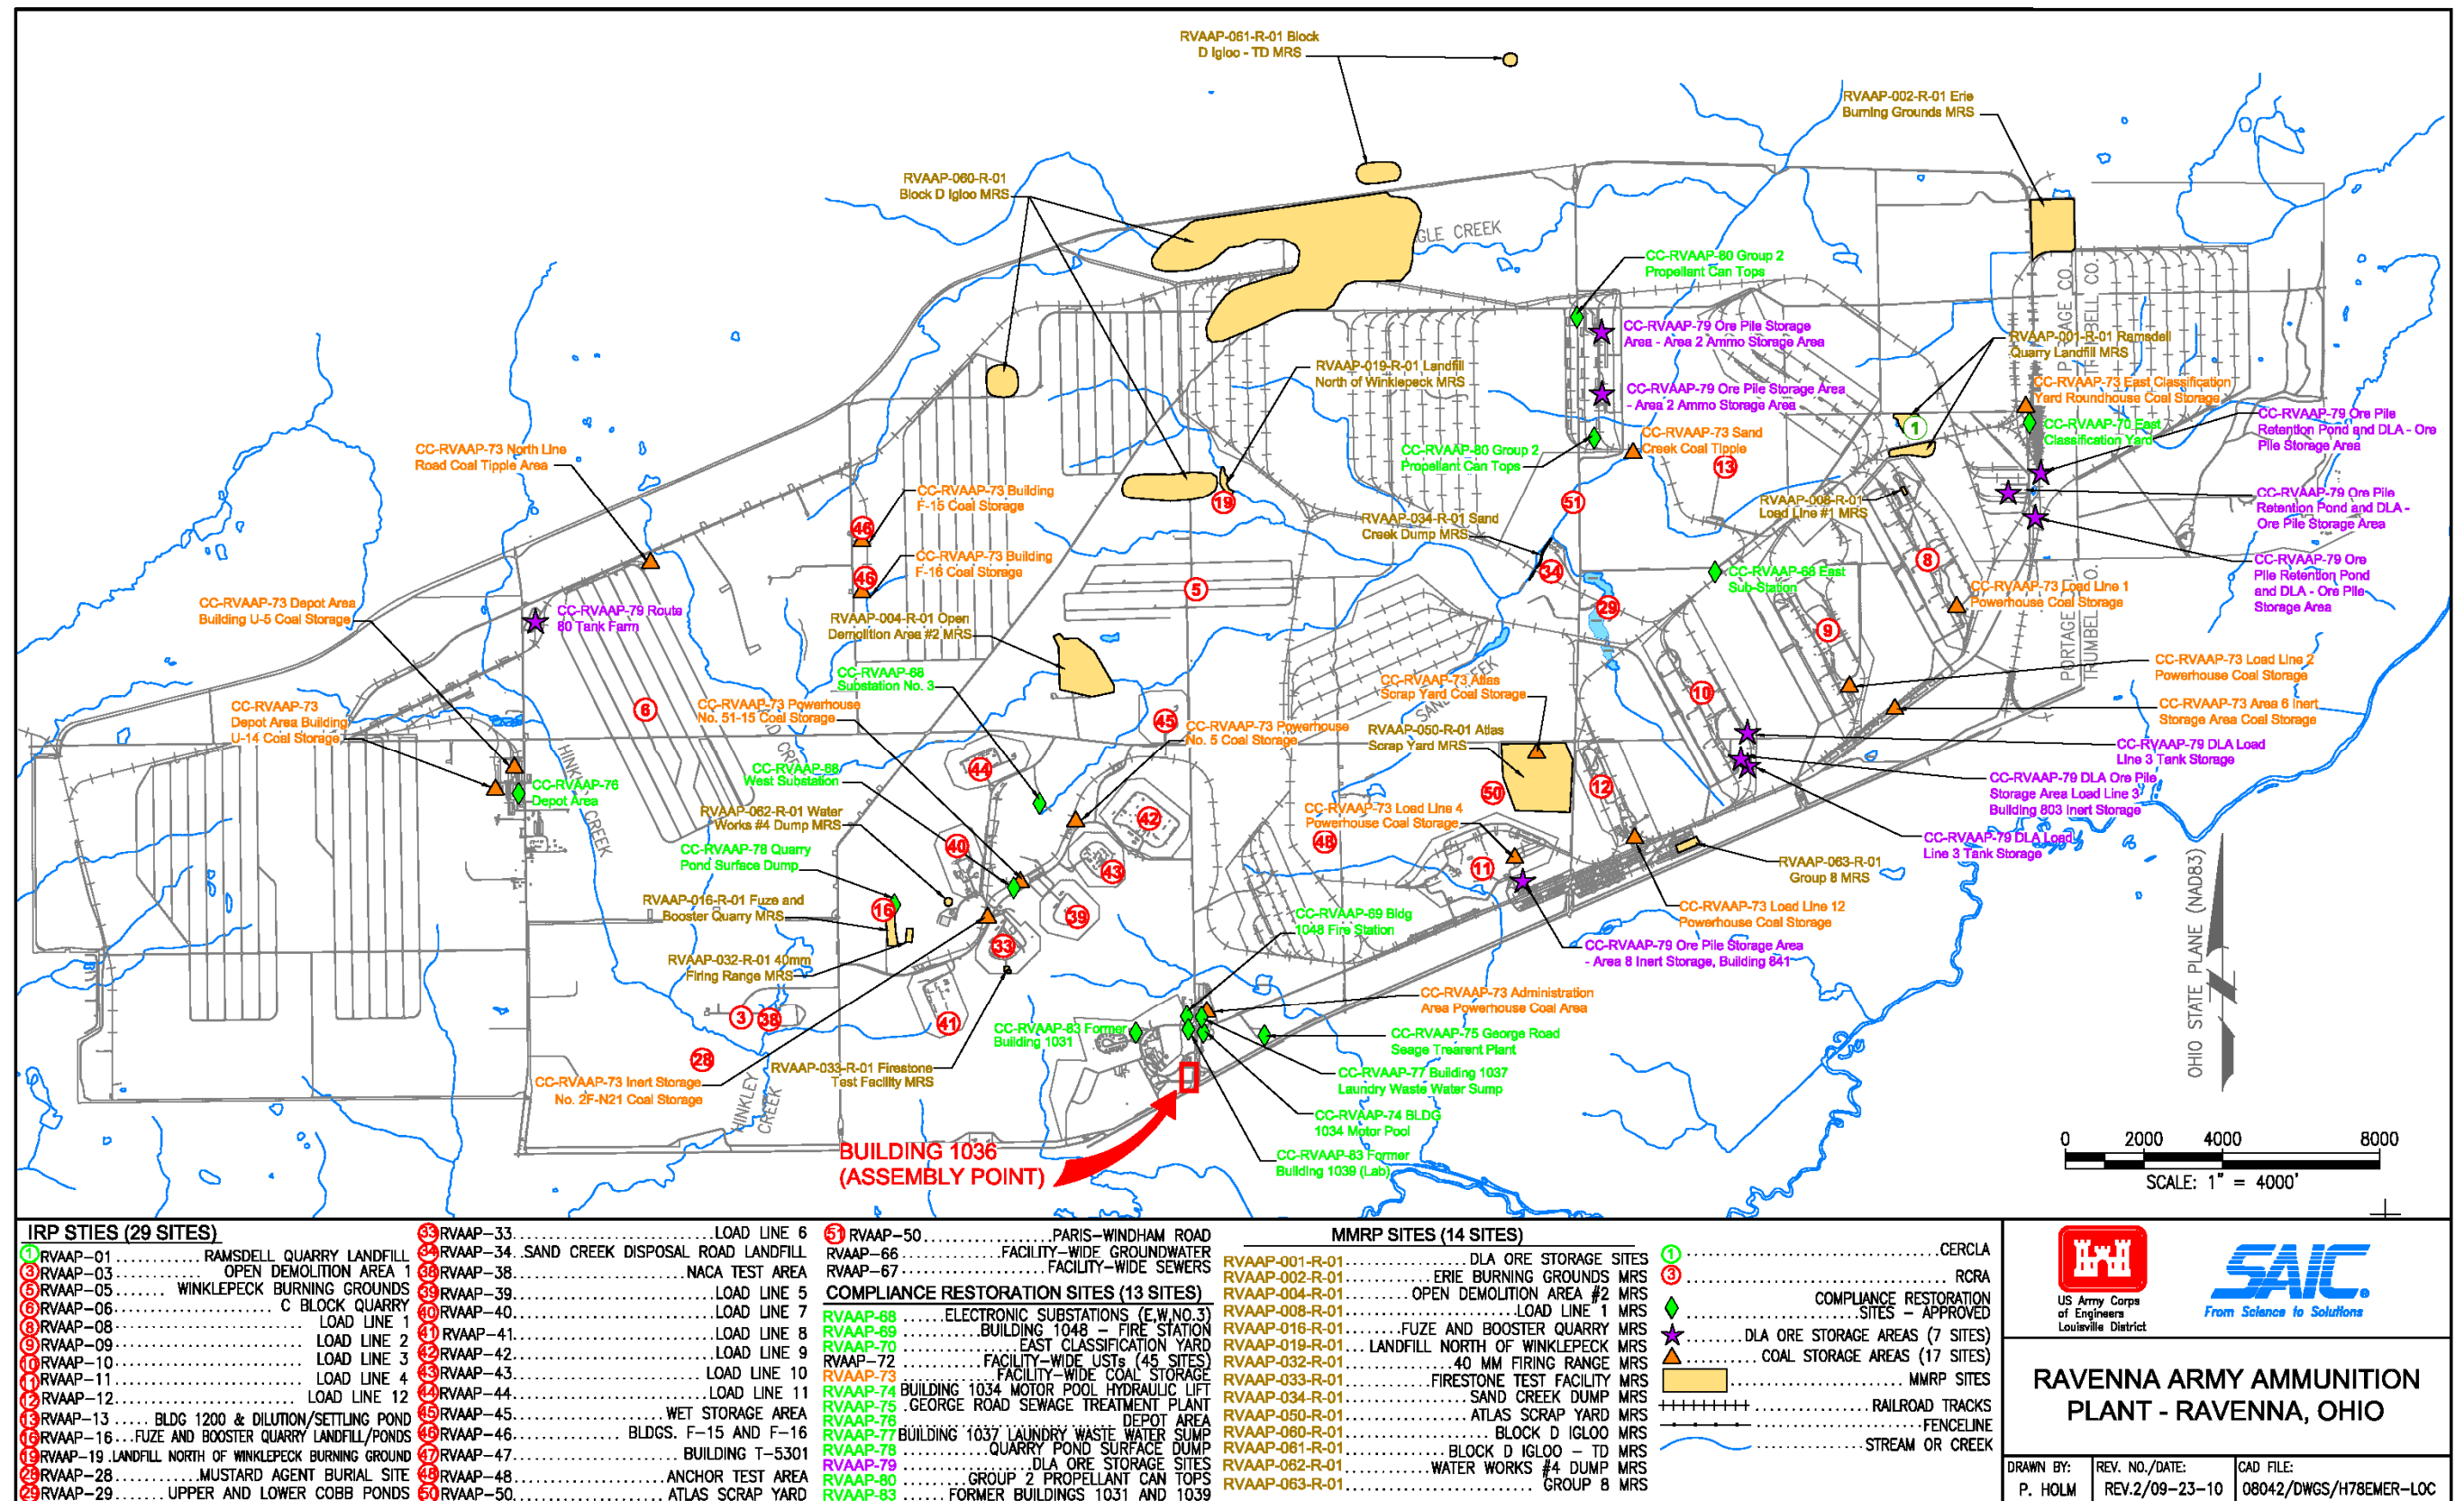

Figure 13-2. RVAAP Facility-wide Assembly Area

**THIS PAGE INTENTIONALLY LEFT BLANK.**

## 14.0 LOGS, REPORTS, AND RECORD KEEPING

---

A system of reports and logs will be used to document activities related to site health and safety. The Field Operations Manager and SSHO will generate a brief weekly summary of health and safety issues and resolutions. These reports will include injuries, accidents, near accidents, interpretations of this FWSHP or regulations, interactions with auditors/regulators/USACE personnel, and any off-normal events. These reports will be limited to one page or less.

In addition to the weekly reports, the following documents will be generated and submitted to the USACE Project Manager:

- Training logs will contain information covered and the signatures of the trainer and those attending. These logs will contain documentation of pre-entry (project start) training, routine (“tailgate”) safety briefings, and visitor training.
- Daily safety inspection logs will contain the dates of inspections, identity of the person doing the inspection, the examined areas/activities/equipment, any deficiencies, and any corrective actions taken.
- Equipment maintenance logs will contain the dates and types of routine maintenance performed on-site equipment.
- The Field Operations Manager will add all employees/visitors to the on-site access roster that is maintained by the RVAAP O&M Contractor. The roster includes the names of all personnel who will perform on-site work or visit the site and certification of required training. It will not contain the names of delivery or similar personnel.
- Environmental and personal exposure monitoring/sampling results will be maintained in a log that will contain monitoring data, location and time of monitoring, types of work being done, calibration records, and the identities of personnel performing monitoring.

Samples of reporting forms are included in Appendix A but any similar or equivalent forms may be used.

**APPENDIX A**  
**REPORTING FORMS**

DAILY SAFETY INSPECTION			
PROJECT: _____			Page 1 of 2
N	Y	NA	Item
			Daily safety briefing conducted
			Emergency numbers and route to hospital posted
			FWSHP and project-specific Addenda on-site, available to employees, and complete
			Required exposure monitoring conducted and documented
			Monitoring instruments (PID, OVA, CGI) calibrated daily against known standard and documented
			First aid kit available and inspected weekly
			Personnel wearing PPE required by SSHP for fieldwork (at least safety shoes or boots, safety glasses with side shields, and nitrile or similar gloves to handle potentially contaminated material)
			Personnel using buddy system (maintain visual or verbal contact and able to render aid)
			If temperature >70°F: heat stress training conducted, cool fluids available, pulse rates of personnel wearing Tyvek are being monitored, work/rest cycle in SSHP being followed
			If temperature <40°F: cold stress training conducted, controls in SSHP implemented
			Personnel using appropriate biological hazard controls (See SSHP)
			Drill rig operating manual on-site
			Drill rigs inspected weekly and documented
			Personnel near drill rig or other overhead hazards wearing hardhats
			Each of two drill rig emergency shutdown devices tested daily
			Employees excluded from under lifted loads
			Unnecessary personnel excluded from hazardous areas, specifically near heavy equipment
			Radius of exclusion zone around drill rig at least equal to mast height
			Personnel wearing hearing protection when within 25 ft of drill rigs, generators, or other noisy equipment
			Containers of flammable liquids closed and labeled properly
			Fully charged fire extinguisher available 25 to 50 ft from flammables storage area and inspected monthly
			Personnel exiting potentially contaminated areas washing hands before eating
			Personnel using steam washer wearing faceshield, hearing protection, heavy duty waterproof gloves, Saranax or rainsuit

# DAILY SAFETY INSPECTION

PROJECT: \_\_\_\_\_ Page 2 of 2

			Portable electrical equipment plugged to a GFCI
			Electrical wiring covered by insulation or enclosure
			Three wire, UL approved, extension cords used
			Housekeeping adequate (walkways clear of loose, sharp or dangerous objects and trip hazards, work areas clear of objects that might fall on employees)
			Walking/working surfaces safe (not slippery, no unguarded holes, no trip hazards)
			Excavations deeper than 5 ft shored or sloped (if personnel will enter) and in compliance with SSHP
			Moving (rotating) machinery guarded to prevent employee contact
			Fall protection provided for work at elevations greater than 4 ft
			All containers of hazardous material labeled to indicate contents and hazards
			MSDSs for hazardous materials on-site
			All vehicles equipped with two-way radios and cellular phones
			15-min eyewash (accessible and full) within 100 ft of areas where corrosive sample preservatives are poured
			Potable and non-potable water labeled
			Chainsaws have anti kick-back protection, personnel wearing cut resistant gloves, protective chaps
			Visitor access controlled
			Site hazards and controls consistent with SSHP
			Site hazard controls appropriate and sufficient

Actions taken to correct or control any "N" responses
